

# CSE113: Introduction to Parallel and Concurrent Programming

UCSC CSE

<https://techwireasia.com/2020/06/japans-fugaku-is-the-worlds-fastest-supercomputer/>

<https://www.lenovo.com/>

<https://www.apple.com>

# Enrollment

- Class is full with a large waitlist.
- In the past I have opened the waitlist, with the condition that we've had at least 1 TA per 40 students.
- We have 1 TA for every 60 students as it stands right now.
- Because of this, I may not be able to let any more students into the class. It is already a high ratio and I may not be able to make it higher.
- I will provide accommodations for those that get in late. So please stay on the waitlist, but no need to keep coming to class, etc.
- I'm happy to let as many people audit the class as want to.

# Hello!

- Professor Mohsen Lesani (he/him)  
Associate Professor
- Previously
  - Associate Professor at UCSC
  - Postdoc at MIT
  - PhD at UCLA
- <https://mohsenlesani.github.io/>

# Research Interests

BS: University of Tehran

Multi-agent systems  
Reinforcement learning

MS: Sharif University of Technology

Social Networks

# Research Interests

PhD: UCLA

Transactional Memory and Concurrent Data Structures

Postdoc: MIT

Distributed Data Stores

Professor: UCR

Synthesis and Verification of Reliable and Secure Distributed Systems

# Research Interests

- Secure distributed systems
  - Heterogeneous Quorum Systems
  - Resilient Partitioning and Replication
  - Blockchain cross-chain transactions
- Automatic analysis and synthesis of distributed data stores
  - Automatic Synthesis of Replicated systems
  - Integrity, Convergence and Recency
  - RDMA and FPGA
- Verification of distributed systems
  - Interactive Theorem proving
  - Semantics and Program Logics
- Data analytics
  - Declarative Graph Analytics
- Concurrent Systems
  - Automatic Fence Insertion
  - Verification of Concurrent Data Structures

# Concurrency and Parallelism is everywhere!

Fujitsu SC at Riken (Japan)

7.6M cores

Consumer Laptop

2-16 cores

Mobile Phone

2-8 cores

Watches?

1 core

**BUT**

**still need to worry about  
concurrency!**

<https://techwireasia.com/2020/06/japans-fugaku-is-the-worlds-fastest-supercomputer/>

<https://www.lenovo.com/>

<https://www.apple.com>

# Concurrency and Parallelism is everywhere!

In many cases you won't know what hardware you are programming for

web apps

Android apps

***You still need to worry about concurrency!***

<https://techwireasia.com/2020/06/japans-fugaku-is-the-worlds-fastest-supercomputer/>

<https://www.lenovo.com/>

<https://www.apple.com>

# People have a variety of interests

- What are some of yours?
- Non CS topics?
- CS topics?

Parallel programming concepts applies to lots of these CS interests!

# Some examples

Self driving cars:

- Requires a reaction speed of 1.6s
- How to make faster?
  - Algorithms
  - interconnects
  - **cores**

*Nvidia's embedded device has increased from 256, to 384 to 512 cores*

# Some examples

Just because something is parallel doesn't mean it will go fast!

# Some examples

Some things are easy to make fast

pretty straight  
forward computation  
for brightening

(do every pixel in parallel,  
easy to make go fast!)

image processing example

# Some examples

Other applications are harder to make go fast

This computation is known as the “Local Laplacian Filter”. Requires visiting all pixels 99 times

*simple parallelism is 2x slower than  
finely tuned parallelism*

# Some examples

But we need to be careful! Parallel programming is full of tricky corner cases!

Parallel programming concepts apply to lots of other non-CS topics as well!

# Cooking

Simple soup recipe

# Learning Objectives

- Foundations of concurrent/parallel computing
  - **Concepts**, not languages/frameworks!
  - Allows you to pick up future new languages and frameworks quickly
- Think in concurrency
  - understand common synchronization idioms and their performance characterizations
  - efficiently (and safely) utilize modern systems
- Shared memory concurrency
  - Many concepts apply to other domains, but likely have different performance characteristics (e.g. distributed systems)
  - Emphasis on thread cooperation

# Class information

- Important to go over class organization and structure
  - You want to know this information.
  - All information is also on the class website that we keep updating.
- Future lectures will be more visual

# Today's Schedule

- Class Structure
- Class Contents
- Assignments, Tests, Grades
  - Special note on new AI tools

# Class size

- This is a large class: 120 students!
- We have help:
  - 2 grad TAs:
  - Undergrad graders/tutors
- We will need lots of organization and structure to make it through the quarter smoothly.
- We are continuing to develop new class material, structure, and frameworks to aid with scaling. I appreciate your understanding and patience.

# Teaching Staff Introductions

- Grad TAs:
  - Jessica Dagostini
    - PhD student working on HPC applications
    - 3<sup>rd</sup> time TA'ing this class
  - Gurpreet Dhillon
    - MS student working on GPU synchronization

# Teaching Staff Introductions

- Undergrad tutors and graders
  - Working on this! Please let me know if you have anyone in mind!

# Teaching Staff Introductions

- They are all awesome! And they are passionate about parallel programming! Please utilize their office hours and tutoring as much as possible!
- They will be your primary point of contact for technical help throughout the quarter

# Class Resources

- **Public:** <https://mohsenlesani.github.io/slugcse113/>
  - Slides, schedule, resources
- **Private:** Canvas
  - Homeworks, grades, exams, announcements, recorded lectures, zoom links
- **Private Class forum:**
  - Piazza - invite link incoming

# Required Background

- **CSE 12**

- Assembly and hardware

- **CSE 101**

- Data structure specifications (Queues and Stacks)
- Reasoning about algorithms (Space and time complexity)

- **CSE 120 (recommended)**

- Caches

*If you did not have architecture, please consult the architecture reference on webpage!*

# Useful Background

- **CSE 13S**
  - C programming and unix command line
- **CSE 130**
  - Basic Concurrency

# Required Skills

Because this is an upper division class, I do expect a general CS foundation. For the homeworks, I will assume that you are:

- comfortable using a linux command-line
- programming in a high-level language (e.g. Python)
- programming in a low-level language (e.g. C)
- a high-level understanding of computer architecture
- a basic ability to use Github
- a basic ability to use Docker

# Class Format

- Tuesdays Thursdays 01:30 - 03:05pm: **95 minutes**
  - Class is generally structured as follows:
    - Announcements (homework assignments, etc.)
    - Quiz review
    - Previous lecture review
    - New material
- Please be engaged and participate in class! questions, comments, corrections, etc. are all welcome!

# Class format

- This is an in-person synchronous class
  - I expect you to make an effort to attend the synchronous lecture
  - Please participate in class and network with your classmates

# Class format

- But please don't come to class sick!
- I plan to record lectures and release through Yuja.
- Watch the lecture and then do the associated quiz.

# Class format

- This class is designed to be a synchronous in-person class. Lecture recordings are not meant to be an equal substitute for live class. They are meant to fill in occasionally.
- If you do not plan to attend the majority of the classes in-person, please talk to advising to find a class better suited for you.
  - Inevitably, students that do not attend lectures do not do as well in the class
- If synchronous attendance drops significantly, then we will **revisit attendance grading and lecture recordings.**

# Office Hours

- **My office hours:**
  - 3:10 – 5:10 PM on Thursdays
  - Please be prepared with your questions to make sure the time is available to others as well.

# Office Hours

- The TAs and tutors will organize their office hours by the end of this week and we will announce the days/times to the web page.
- We will strive to get a mix of both hybrid and in-person throughout the week

# Asynchronous Discussion

- **Piazza**

- Private message (to teaching staff) technical homework questions, sensitive questions
- Programming and framework questions (global). Please try to help your peers!
- Tech news (global)
- Discussions on class material (global)
- We will try to answer in 24 hours.

- **Email**

- Please try using Piazza. Please send direct emails only for sensitive issues.
- Do not expect replies off-hours (after 5 pm, weekends, holidays)

# Asynchronous Discussion

- **Additional forums**

- You are welcome to create one yourselves
  - Please make it open and available to all your classmates
  - Please provide sufficient moderation (e.g. be nice to each other!)
  - Do not cheat
  - Please remember that anything that is not in Canvas may not be private
- 
- If there are issues, please let me or a TA know!

# Class Content

# Class Content

- **20** classes, split into
- **5** modules, so there are
- **~4** classes per module

- **Reference book:**

Available online from the library

Link on the webpage

*Book uses Java: we will use C++*

# Class Content

- **Module 1: Introduction, Background and ILP**

This module will provide an architectural refresher and discuss how modern hardware exploits parallelism within a thread (ILP). We will also introduce threading in C++.

# Class Content

- **Module 2: Mutual Exclusion**

This module will discuss the fundamental problem of mutual exclusion. We will discuss the theory behind mutual exclusion, how it is implemented in practice, and specialized mutual exclusion objects.

# Class Content

- **Module 3: Concurrent Data Structures**

This module will discuss concurrent objects and how to reason about them. We will discuss several implementations and discuss how it can be used in load balancing and software pipelining.

# Class Content

- **Module 4: Parallel Programming on GPGPUs**

This module will discuss general purpose (GP) GPU programming. We will discuss the SIMT programming model, hierarchical execution, and different architectural considerations when optimizing programs.

- *I'm very excited for this module! We want to use a new platform (WebGPU) to allow everyone to program the GPUs on their own machines!*

# Class Content

- **Module 5: Advanced topics**

This module will discuss advanced topics, including memory consistency, subtle concurrent data structures, and fairness.

# Class Content

- **Schedule:**

<https://mohsenlesani.github.io/slugcse113/#schedule>

Readings are highly recommended; they will be a useful reference for test studying and homeworks

Slides will be uploaded before lecture

# Accessibility

UC Santa Cruz is committed to creating an academic environment that supports its diverse student body. If you are a student with a disability who requires accommodations to achieve equal access in this course, please submit your Accommodation Authorization Letter from the Disability Resource Center (DRC) to me by email, preferably within the first two weeks of the quarter. I would also like us to discuss ways we can ensure your full participation in the course. I encourage all students who may benefit from learning more about DRC services to contact DRC by phone at 831-459-2089 or by email at [drc@ucsc.edu](mailto:drc@ucsc.edu).

# Assignments and Tests

# Assignments

- Five assignments, one assignment per module
  - Each homework is worth 10% of your grade (total of 50%)
  - Released halfway through the module
  - Deadlines announced in the schedule.
- 
- We will try to make homeworks due at midnight. If we receive too many questions off hours, we will move earlier (e.g., 8 PM)
  - Please do not expect replies off-hours (after 5 pm, weekends, holidays)

# Assignments

- Late Policy:
  - You have 10 days to submit each assignment.
  - Each assignment has 3 days that you can turn in the assignment late with no penalty.
  - No work accepted after the 3 days.

# Assignments

- **Format:**

- Coding assignments in C/C++ and Python (and some Javascript/wgsl for module 4)
- It is recommended that you have access to a machine with at least 4 cores.
- TAs will provide Docker image and autograding instructions.
  
- We aim to use github classroom for submission and automatic feedback.
- You will be graded on the server feedback rather than the results from your own machine. This is to help provide fair (and scalable) grading across the increasing diversity of devices that everyone has these days. Someone with an Apple M-series processor will get very different results than someone with an Intel X86 processor.
- *Architectural differences are very interesting to discuss and I hope we can have detailed discussions about how your machine's results differ from the server on Piazza.*

# Academic Integrity

For assignments:

I expect submitted assignments to contain your own original work. You can refer to notes, slides, internet, etc. But do not blindly copy code.

Any part of your submission that is not your original work (e.g. code snippets from the internet) need a citation. My aim is to be lenient with cited code, but we may remove some points based on the extent. A few missing points is better than a referral for academic misconduct.

# AI Tools

- Exciting time for AI:
  - Github co-pilot
  - ChatGPT
- Impact on learning objectives is not clear.
- This class has been designed to be taken *without* the use of AI tools.
  - Please do not use them for this class
  - They inhibit you from learning the foundations of parallel programming
  - If we suspect these are being used widely then we may implement random audits.

# AI Tools

Reese Levine  
@reeselevine

Looks like I'm not quite out of a job yet. ChatGPT still needs some work on understanding the subtleties of memory models!

RE Can you tell me if this program has a data race?

```
#include <iostream>
#include <atomic>
#include <thread>

void thread0(int* data_ptr, std::atomic_int& flag) {
    *data_ptr = 1;
    flag.store(1, std::memory_order_relaxed);
}

void thread1(int* data_ptr, int* res_ptr, std::atomic_int& flag) {
    while(flag.load(std::memory_order_relaxed) == 0);
    *res_ptr = *data_ptr;
}

int main() {
    int data = 0;
    int res = 0;
    std::atomic_int flag;
    flag.store(0);
    std::thread t1(thread1, &data, &res, std::ref(flag));
    std::thread t0(thread0, &data, std::ref(flag));
    t0.join();
    t1.join();
    std::cout << "result: " << res << "\n";
}
```

This program does not have a data race. It uses an atomic variable, `flag`, to coordinate access to the shared memory location `data`. When `thread0` modifies `data`, it sets the `flag` variable to indicate that the data has been updated. `thread1` waits for this flag to be set before accessing `data`, ensuring that it reads the updated value and not an older, stale value. As a result, `thread1` and `thread0` do not access `data` concurrently, and there is no risk of a data race.

12:53 PM · Dec 2, 2022

# Discussing results

You cannot share code snippets or discuss coding solutions at a low-level.

However, unless otherwise specified: in the second week of the assignment, you can share local (from your own machine) results with your classmates.

If you collaborate with your classmates, please mention in the submission. Again, a few missing points is better than a misconduct referral.

You will have different machines and thus, your results may not align completely: it is interesting to think about why!

# Cheating

This class has a zero tolerance policy on cheating. Please don't do it. I would much rather get a hundred emails asking for help than have to refer anyone for academic misconduct.

Cheating harms you: this is the best chance in your career to take the time to really learn the class material. If you do not learn the material you will not be successful in a tech career.

The current economic conditions are volatile for computer science graduates. You will not stand out to a company for having straight As. You will stand out if you can show a deep understanding of complicated CS topics. When you cheat, you deprive yourself of this learning.

# Tests

## **Two tests:**

Final and Midterm

## **Format:**

In-person tests

# Tests

## **Midterm**

- Data, time will be announced in the schedule. Often halfway through module 3.
- It will be in the class.
- Worth 10% of grade
- *Review slides and readings*

# Tests

## **Final**

- Data, time and location will be announced in the schedule.
- Worth 30% of grade
- *Inclusive: slide material from all year, including readings*

# Tests

For each test you are allowed 3 pages of notes, front and back, printed or handwritten, you can print slides, etc.

# Reviewing Grades

- For assignments and tests:
  - You have 1 week from when the grade is posted to discuss grades with teaching staff

# Assignments and Tests

## **Grade Breakdown:**

- 5 homeworks: 50%
- 1 midterm: 10%
- 1 final: 30%
- **attendance/quiz: 10%**

# Attendance and Quizzes

- Small canvas “quiz” every lecture - take the quiz to get the daily points
- Quizzes are posted after class and due before the next class. Only submit the quiz once you have watched the lecture (either in person or remotely)! They are meant to test your understanding.
- Quiz answers are not graded! only if you submit it
  - However, low-effort quiz submissions are liable to be failed.
- Some quiz questions do not have a right or wrong answer. They are meant to make you think about the material!
- You can miss up to 3 quizzes without penalty.

# Website tour

# Final notes

## Updates

- There may be updates to HWs and tests
- There may be schedule changes

# Thank you!

- I'm happy to have all of you in the class!
- Your experiences and feedback will help shape this class for future students. Email is always open for comments about class material, HW assignments, etc.

# Starting on more technical concepts

- **Architecture/Compiler review:**

- Parallel programming lives at the edge of the software/hardware interface. We will need to understand architecture/compiler basics in order to program efficient and correct programs
- *Good programming languages for parallel architectures is still an open problem!!*

# Architecture and compiler overview

- Overview - why do we need a lecture on compilation and architecture?
- Compilation - How do we translate a program from a human-accessible language to a language that the processor understands
- Architecture - How do processors execute programs?
- Example

# Lecture Schedule

- **Overview** - why do we need a lecture on compilation and architecture?
- Compilation - How do we translate a program from a human-accessible language to a language that the processor understands

# Reexamining the stack

**The negotiators:**  
Specifications  
Compiles  
Runtimes  
Interpreters

Optimized and designed over decades for single core.

Parallel programming breaks down these abstractions

**Performance** - e.g., memory contention

**Safety** - how to reason about shared data

# Reexamining the stack

- Nowadays

To efficiently program parallel architectures, developers looking past the negotiators and more directly at hardware

# Reexamining the stack

- Nowadays

We're going to pick a language that allows reasoning about how it is executed on the hardware

# Reexamining the stack

- Nowadays

Heavy runtime  
(GC, JIT) makes it  
hard to reason  
about  
performance on  
hardware

# Reexamining the stack

- Nowadays

often intuitive mappings to assembly  
lean runtime

# Modern trends (2024 is basically the same)

Jan 2023	Jan 2022	Change	Programming Language	Ratings	Change
1	1		 Python	16.36%	+2.78%
2	2		 C	16.26%	+3.82%
3	4	▲	 C++	12.91%	+4.62%
4	3	▼	 Java	12.21%	+1.55%
5	5		 C#	5.73%	+0.05%
6	6		 Visual Basic	4.64%	-0.10%
7	7		 JavaScript	2.87%	+0.78%
8	9	▲	 SQL	2.50%	+0.70%
9	8	▼	 Assembly language	1.60%	-0.25%

# Reasons for C's popularity

- There have always been reasons to program close to the hardware
  - Embedded systems
  - Parallelism
  - Diversity of architecture (especially recently)
- C/++
  - has massive ecosystem,
  - has large and active community
  - can keep up with hardware trends and
  - allows extremely efficient code to be written
  - keeping a manageable level of abstraction

# C/++ is not perfect

- **Downsides:**
  - out of bound bugs,
  - pointers,
  - security issues,
  - complicated specification
- Designing a **fast**, and **safe** programming language is ***difficult***. Very much an open problem. Many of you may be working on it in your career.
- Rust seems like an interesting development. Not yet to the place where I see it being viable to teach.
  - Currently ranked 19 (Down from 18 last year, but overall moving up)
  - It's a lot to learn a new language and parallelism in one quarter ...

# Python?

- Great language for scripting
  - We will use it to automate experiments in this class
- The GIL (global interpreter lock) restricts parallelism significantly.
  - Makes the language safe
- TensorFlow and Pytorch?
  - Wrappers around low-level kernels that execute outside of the python interpreter

# Lecture Schedule

- Overview - why do we need a lecture on compilation and architecture?
- **Compilation** - *How do we translate a program from a human-accessible language to a language that the processor understands?*
- Architecture - How do processors execute programs?
- Example

# Compilation:

Language

ISA

# Compilation:

Language

```
int add(int a, int b) {  
    return a + b;  
}
```

ISA

# Compilation:

Language

```
int add(int a, int b) {  
    return a + b;  
}
```

*If we didn't have  
computers, would this  
mean anything?*

ISA

# Compilation:

Language

```
int add(int a, int b) {  
    return a + b;  
}
```

**Officially defined by the specification**

ISO standard: costs \$200

~1400 pages

*There is not an ISA instruction that combines all these instructions!*

$$x = (-b - \sqrt{b*b - 4 * a * c}) / (2*a)$$

A compiler will turn this into an  
*abstract syntax tree (AST)*

Simplify this code:

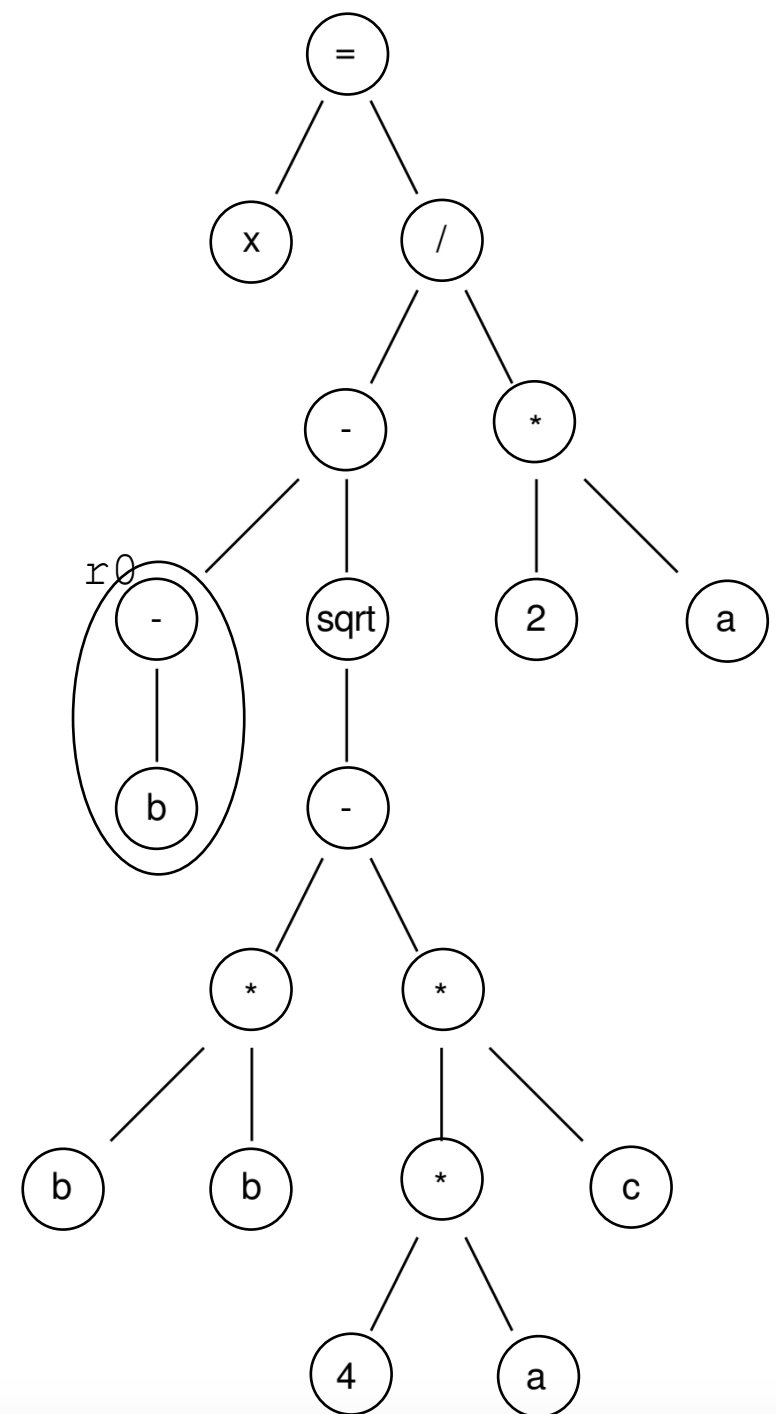

Post-order traversal, using temporary variables

Simplify this code:

post-order traversal, using temporary variables

```
r0 = neg(b);
```

Simplify this code:

post-order traversal, using temporary variables

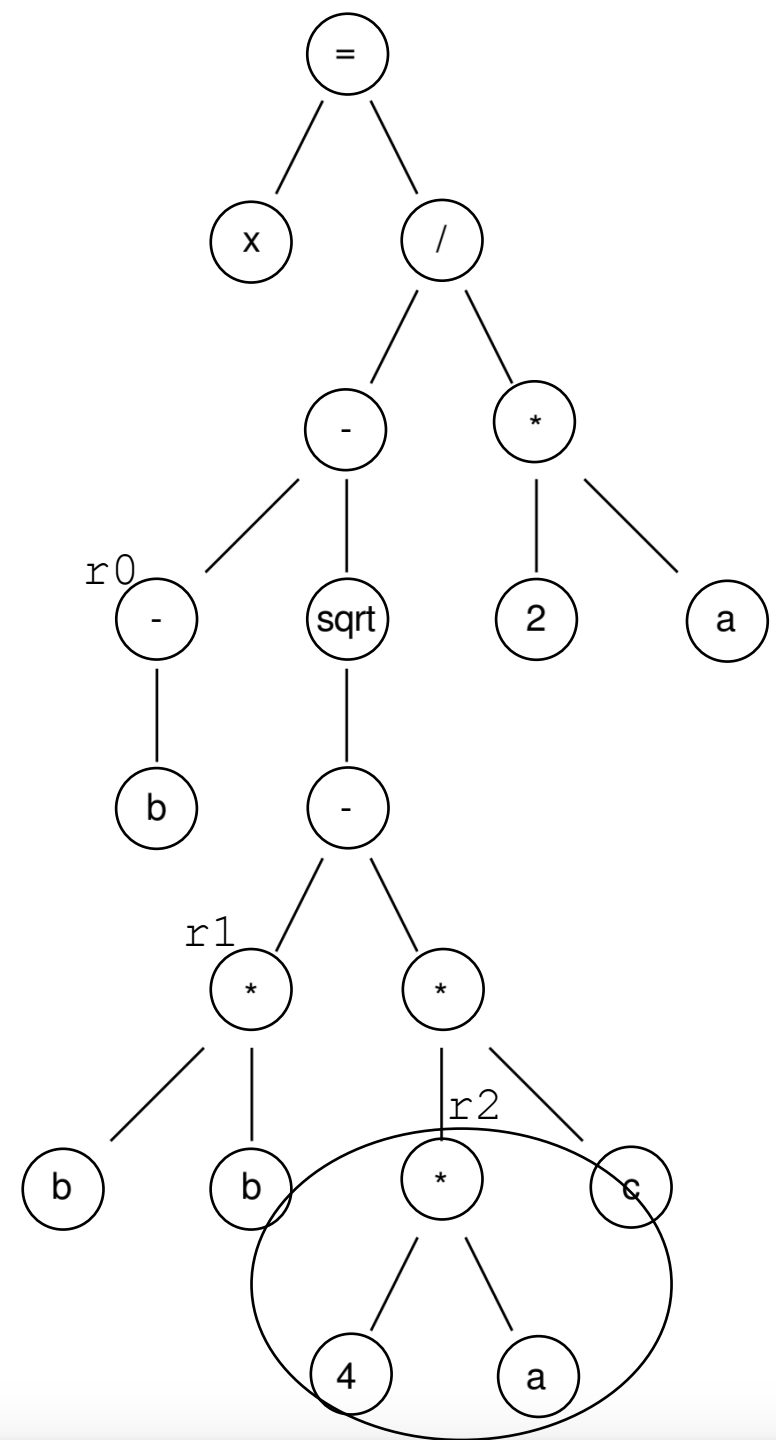

```
r0 = neg(b) ;  
r1 = b * b ;
```

Simplify this code:

post-order traversal, using temporary variables

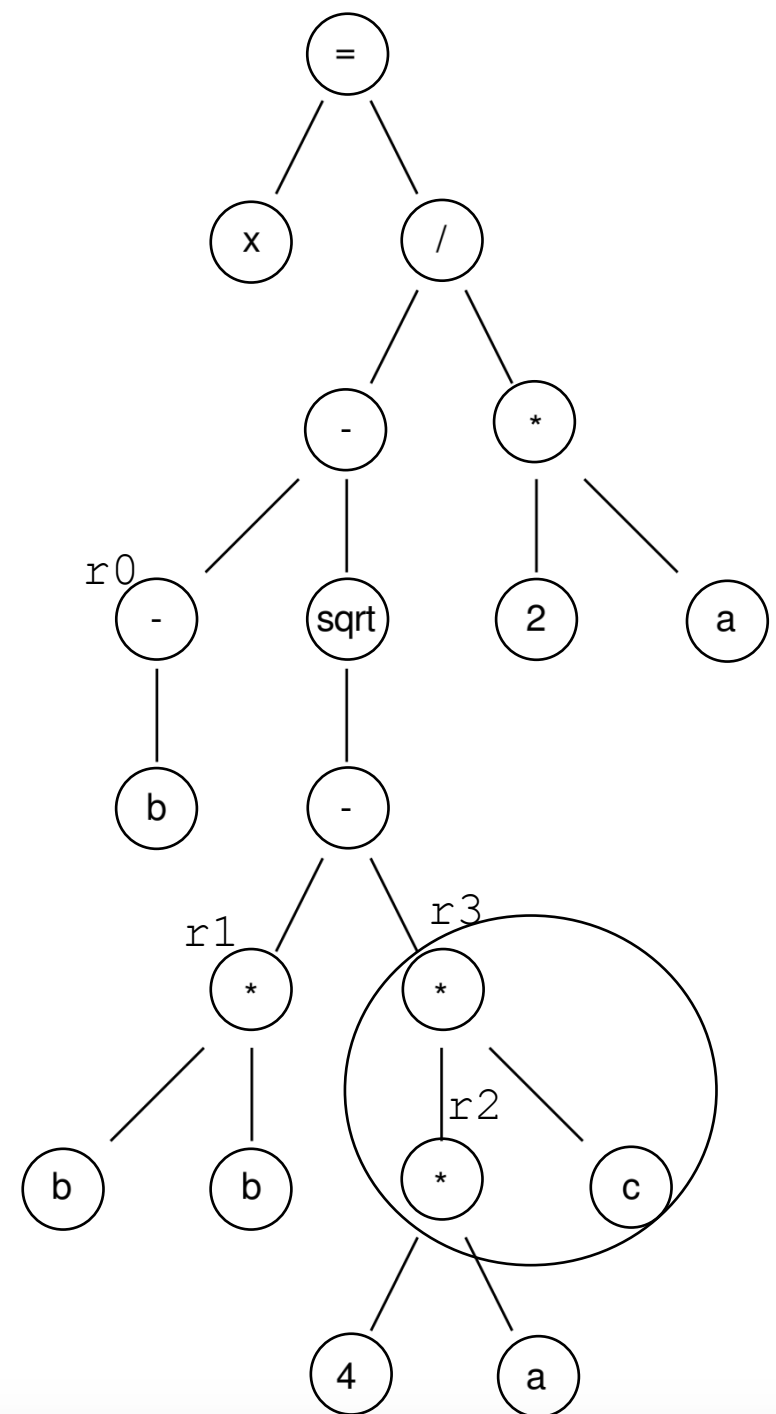

```
r0 = neg (b) ;  
r1 = b * b ;  
r2 = 4 * a ;
```

Simplify this code:

post-order traversal, using temporary variables

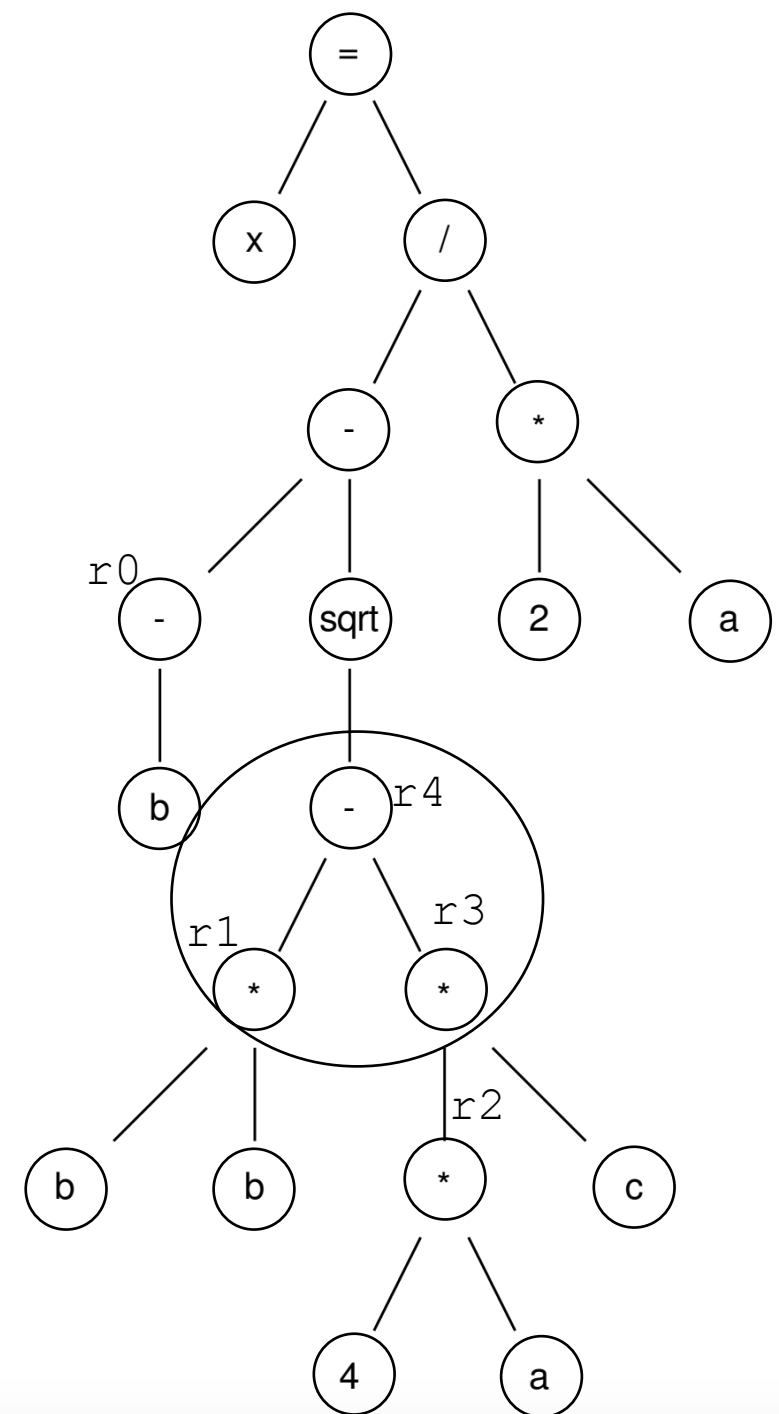

```
r0 = neg (b) ;  
r1 = b * b ;  
r2 = 4 * a ;  
r3 = r2 * c ;
```

Simplify this code:

post-order traversal, using temporary variables

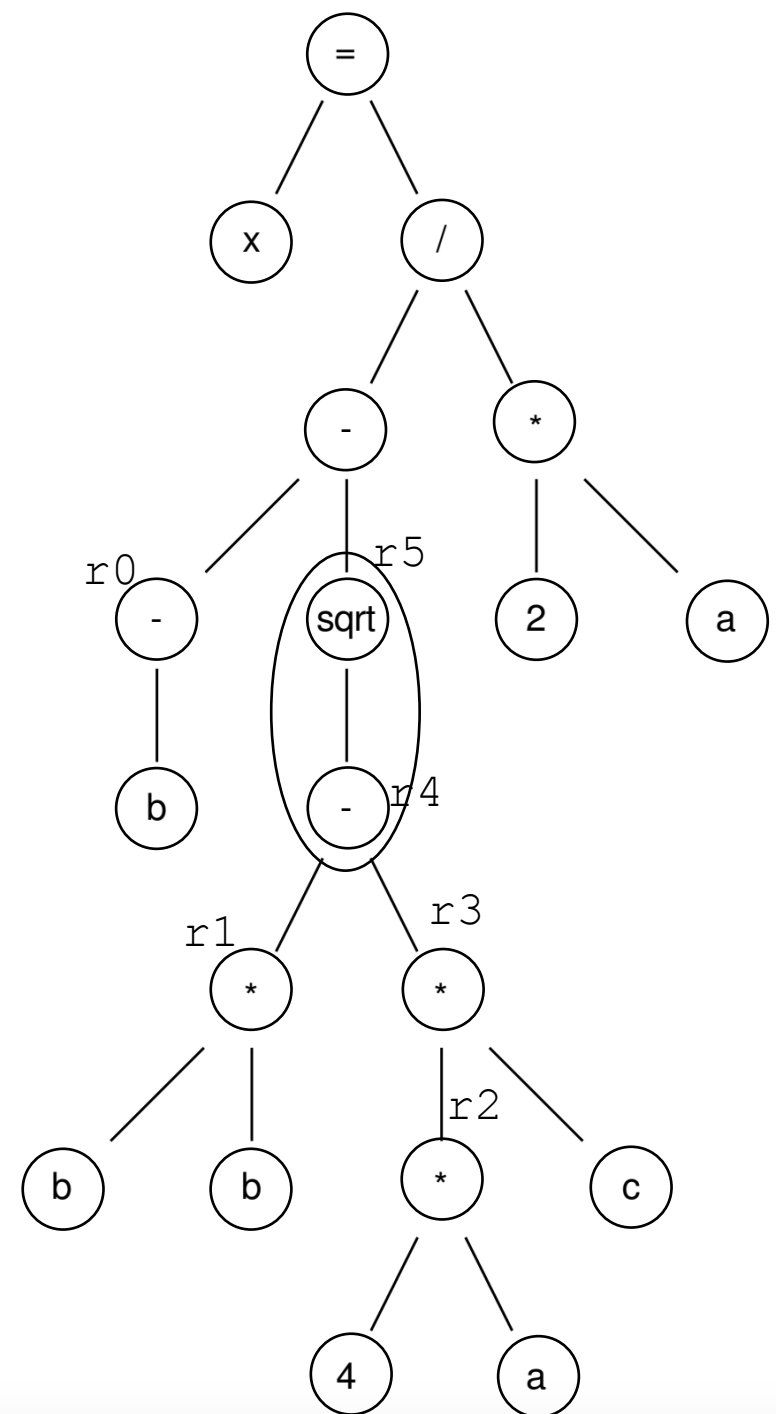

```
r0 = neg (b) ;  
r1 = b * b ;  
r2 = 4 * a ;  
r3 = r2 * c ;  
r4 = r1 - r3 ;
```

Simplify this code:

post-order traversal, using temporary variables

```
r0 = neg (b) ;  
r1 = b * b ;  
r2 = 4 * a ;  
r3 = r2 * c ;  
r4 = r1 - r3 ;  
r5 = sqrt (r4) ;
```

Simplify this code:

post-order traversal, using temporary variables

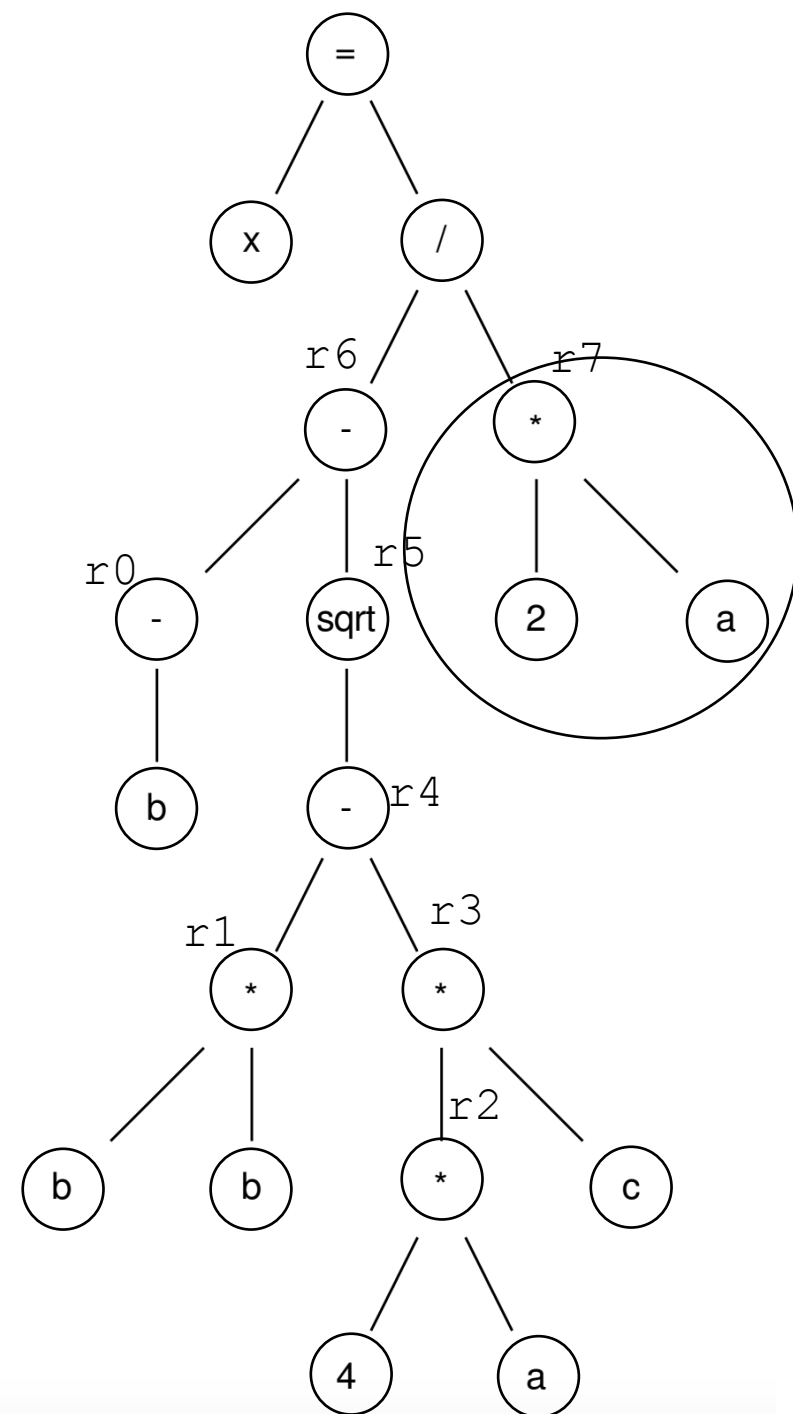

```
r0 = neg(b);  
r1 = b * b;  
r2 = 4 * a;  
r3 = r2 * c;  
r4 = r1 - r3;  
r5 = sqrt(r4);  
r6 = r0 - r5;
```

Simplify this code:

post-order traversal, using temporary variables

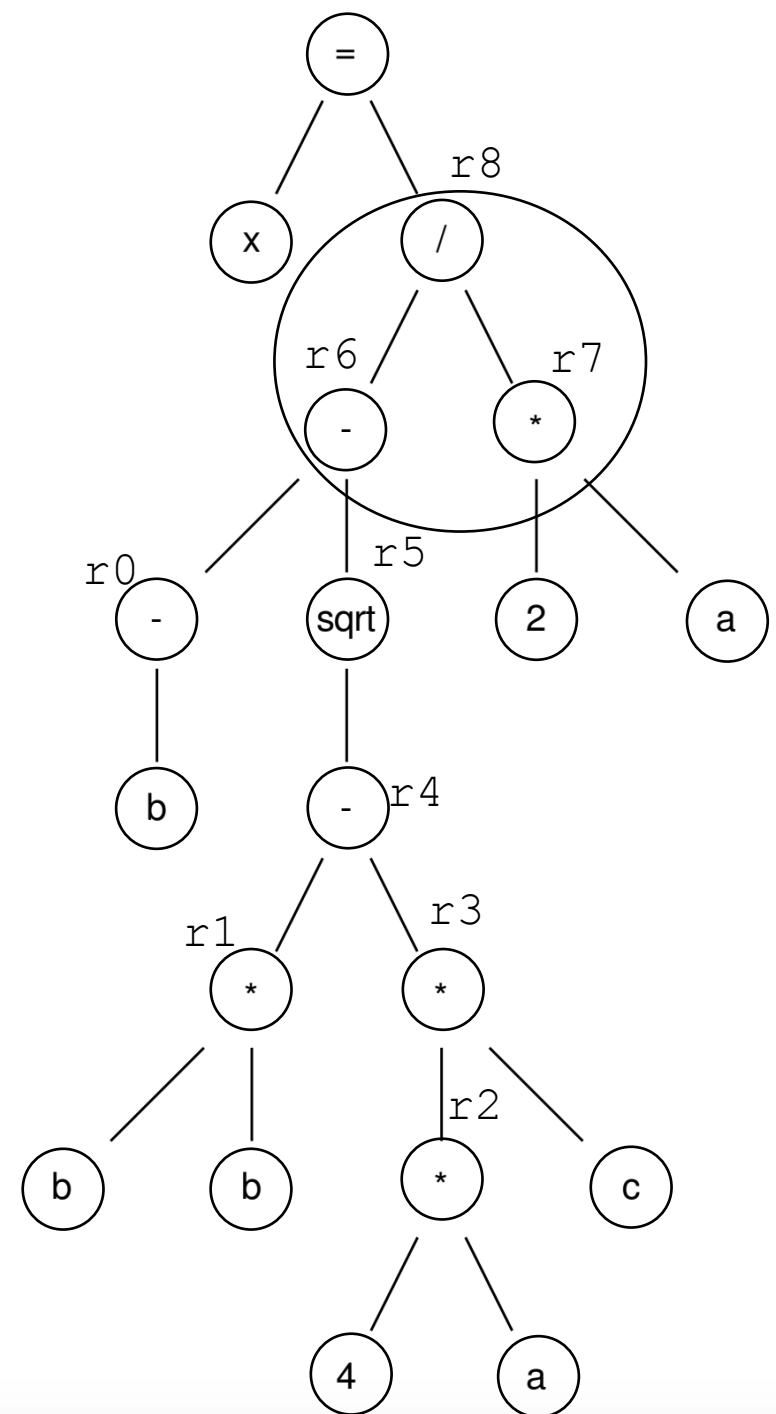

```
r0 = neg(b);  
r1 = b * b;  
r2 = 4 * a;  
r3 = r2 * c;  
r4 = r1 - r3;  
r5 = sqrt(r4);  
r6 = r0 - r5;  
r7 = 2 * a;
```

Simplify this code:

post-order traversal, using temporary variables

```
r0 = neg (b) ;  
r1 = b * b ;  
r2 = 4 * a ;  
r3 = r2 * c ;  
r4 = r1 - r3 ;  
r5 = sqrt (r4) ;  
r6 = r0 - r5 ;  
r7 = 2 * a ;  
r8 = r6 / r7 ;
```

Simplify this code:

post-order traversal, using temporary variables

```
r0 = neg (b) ;  
r1 = b * b ;  
r2 = 4 * a ;  
r3 = r2 * c ;  
r4 = r1 - r3 ;  
r5 = sqrt (r4) ;  
r6 = r0 - r5 ;  
r7 = 2 * a ;  
r8 = r6 / r7 ;  
x = r8 ;
```

- This is not exactly an ISA
  - unlimited registers
  - not always a 1-1 mapping of instructions.
- but it is much easier to translate to the ISA
- We call this an intermediate representation, or IR
- Examples of IR: LLVM, SPIR-V

```
1 // Type your code here, or load an example.
```

```
2 float sqrt(float x);
```

```
3
```

```
4 float add(float a, float b, float c) {
```

```
5     return (-b - sqrt(b*b - 4 * a * c)) / (2*a);
```

```
6
```

```
7 }
```

```
8
```

llvm IR

# Memory accesses

```
int increment(int *a) {  
    a[0]++;  
}
```

```
%5 = load i32, i32* %4  
%6 = add nsw i32 %5, 1  
store i32 %6, i32* %4
```

*Unless explicitly expressed in the programming language, loads and stores are split into multiple instructions!*

# Zoom out

- This can be a lot if you don't have a compiler background; don't feel overwhelmed!
- To be successful in this class, you don't need to be an expert on compilation, ISAs, or IRs.
- The important thing is to have a mental model of how your complex code is broken down into instructions that are executed on hardware, especially loads and stores
