# Broadcast Execution Diagram

# Overview

---

- **Motivation: why causal broadcast?**
- Properties of causal broadcast
- Protocols

# Intuition

---

- So far, we did not consider ordering among messages; In particular, we considered messages to be independent
- Two messages from the same process might not be delivered in the order they were broadcast
- A message  $m_1$  that causes a message  $m_2$  might be delivered by some process after  $m_2$
- Consider a news or social network where every new event contains a reference to the event that caused it.

# Overview

---

- Motivation: why causal broadcast?
- **Properties of causal broadcast**
- Protocols

# Causal Order Property

---

If any process  $p_i$  delivers a message  $m_2$ ,  
then  $p_i$  must have delivered every message  $m_1$  that  $m_2$  is **dependent** on.

# Causal Relation (Dependency)

---

Let  $m_1$  and  $m_2$  be any two messages.

$m_1 < m_2$  ( $m_1$  is causally before  $m_2$ , or  $m_2$  depends on  $m_1$ ) iff

- **FIFO order:**

- A process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$ .

- ...

- ...

# Example 1: FIFO Order

---

If a process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$  then  $m_1 < m_2$ .

P1

P2

P3

# Example 1: FIFO Order

If a process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$  then  $m_1 < m_2$ .

broadcast( $m_1$ )

# Example 1: FIFO Order

If a process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$  then  $m_1 < m_2$ .

broadcast( $m_1$ )

# Example 1: FIFO Order

If a process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$  then  $m_1 < m_2$ .

# Example 1: FIFO Order

If a process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$  then  $m_1 < m_2$ .

# Example 1: FIFO Order

If a process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$  then  $m_1 < m_2$ .

**broadcast(m1)**   **deliver(m1)**   **broadcast(m2)**

# Example 1: FIFO Order

If a process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$  then  $m_1 < m_2$ .

**broadcast(m1)**   **deliver(m1)**   **broadcast(m2)**

# Example 1: FIFO Order

If a process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$  then  $m_1 < m_2$ .

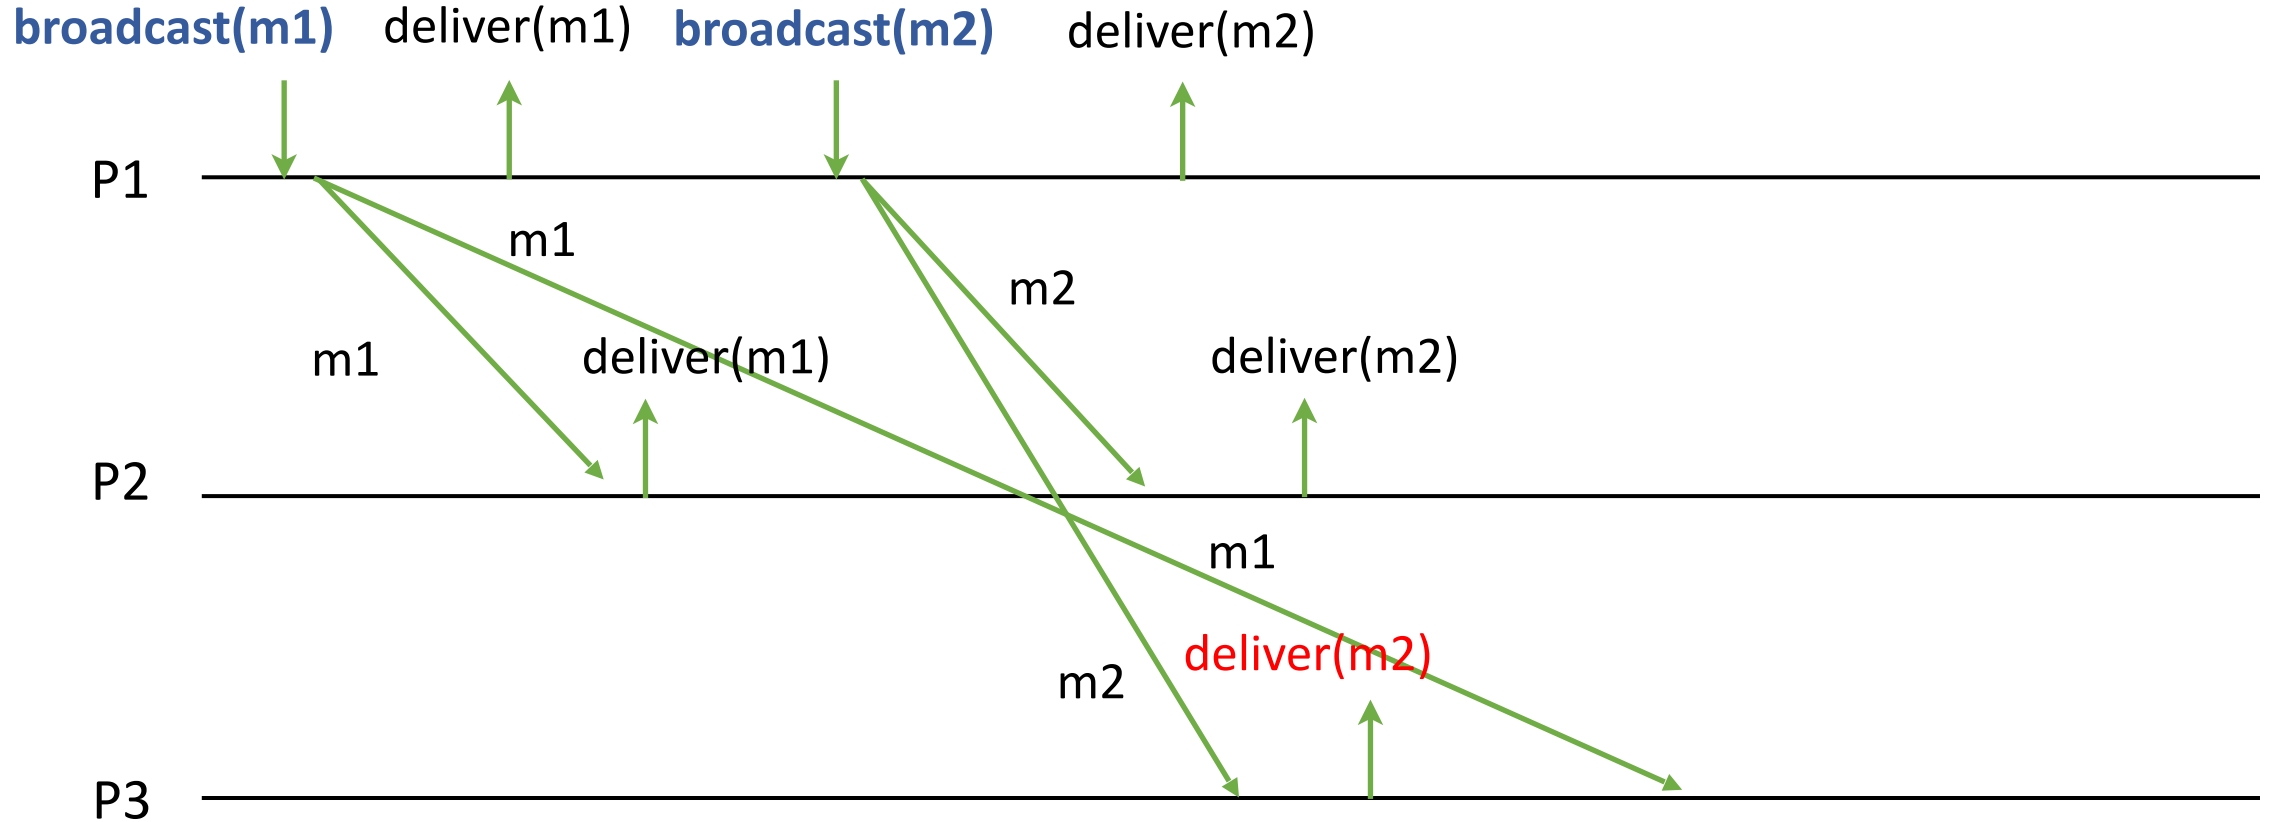

# Example 1: FIFO Order

If a process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$  then  $m_1 < m_2$ .

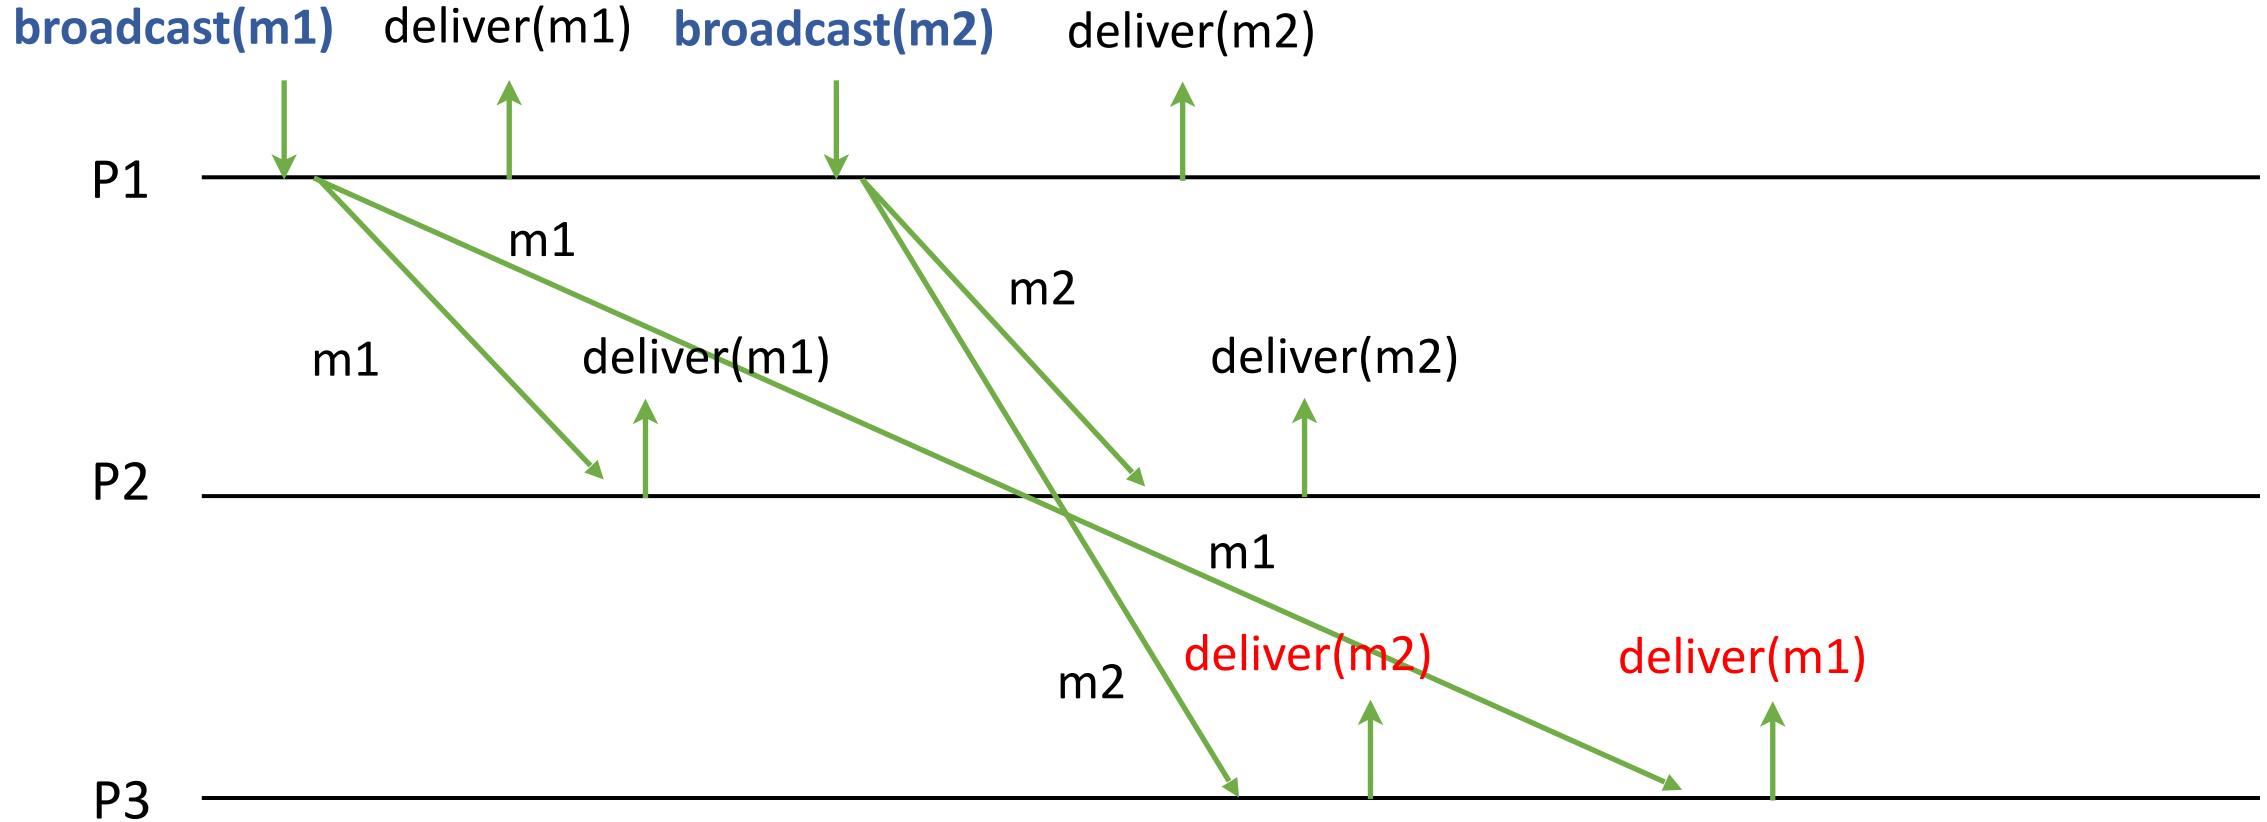

# Example 1: FIFO Order

If a process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$  then  $m_1 < m_2$ .

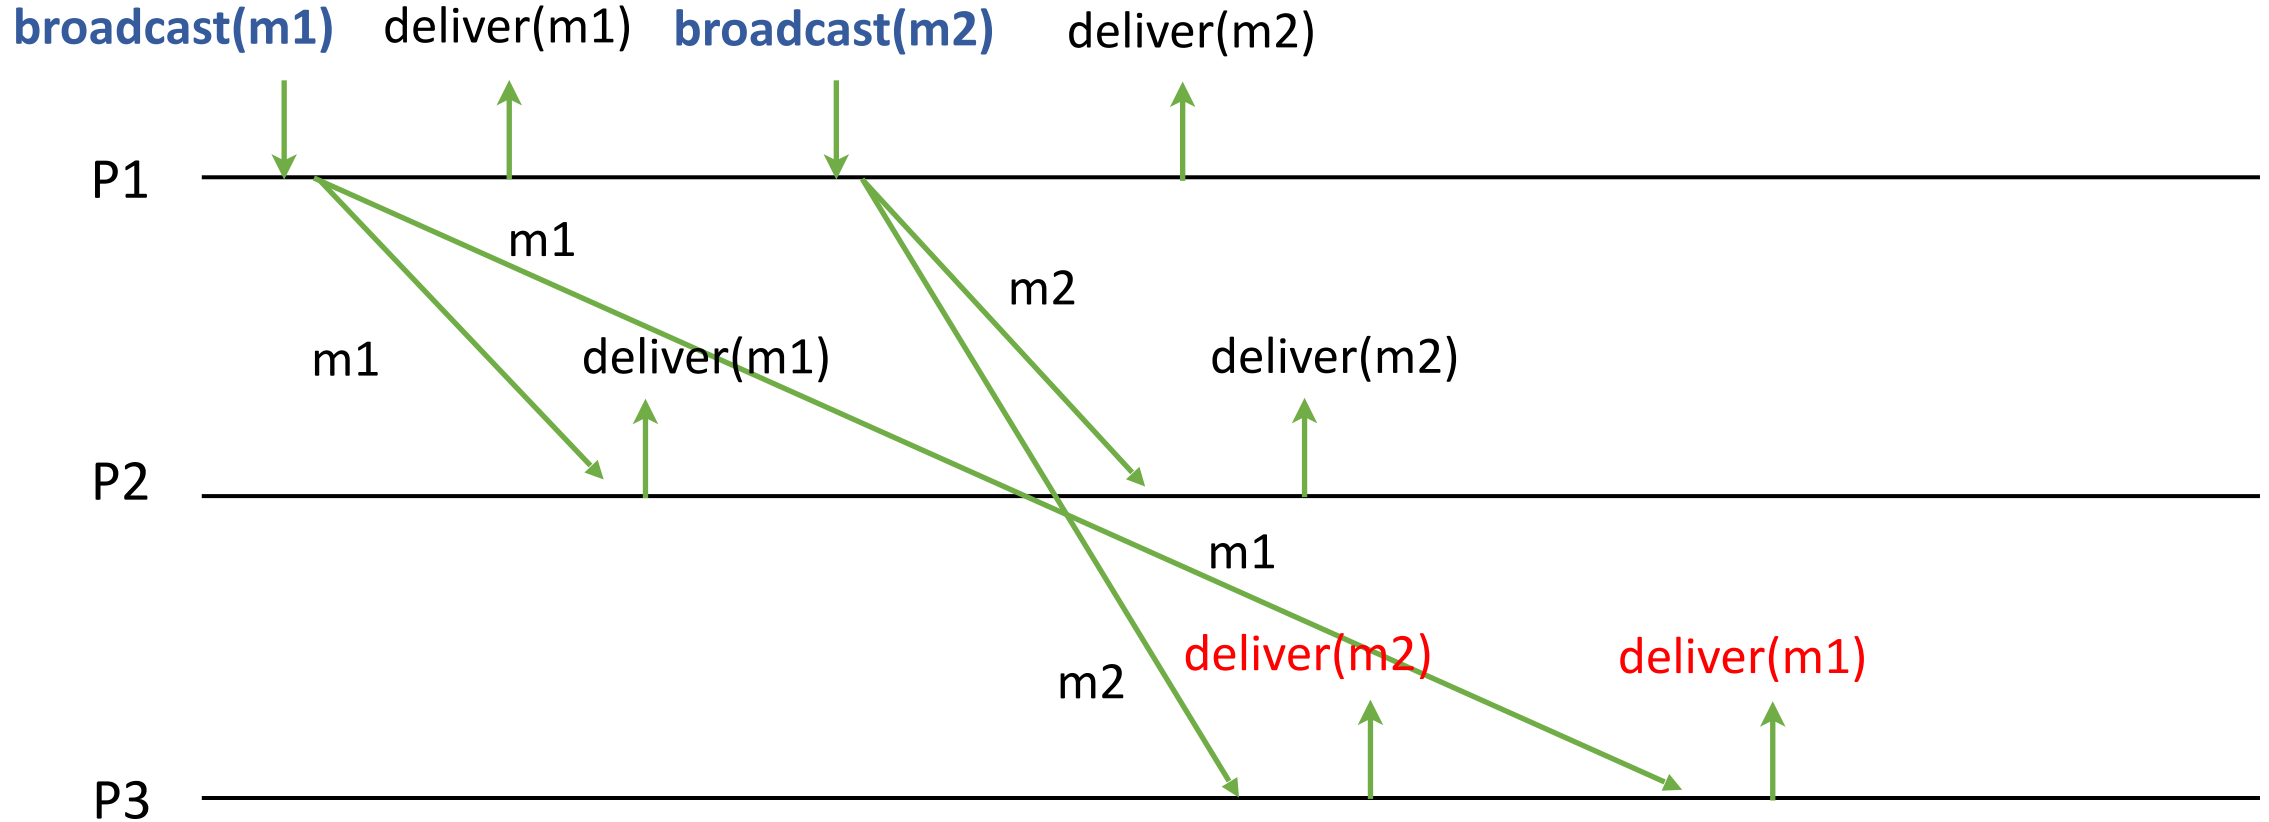

# Example 1: FIFO Order

If a process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$  then  $m_1 < m_2$ .

# Example 1: FIFO Order

If a process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$  then  $m_1 < m_2$ .

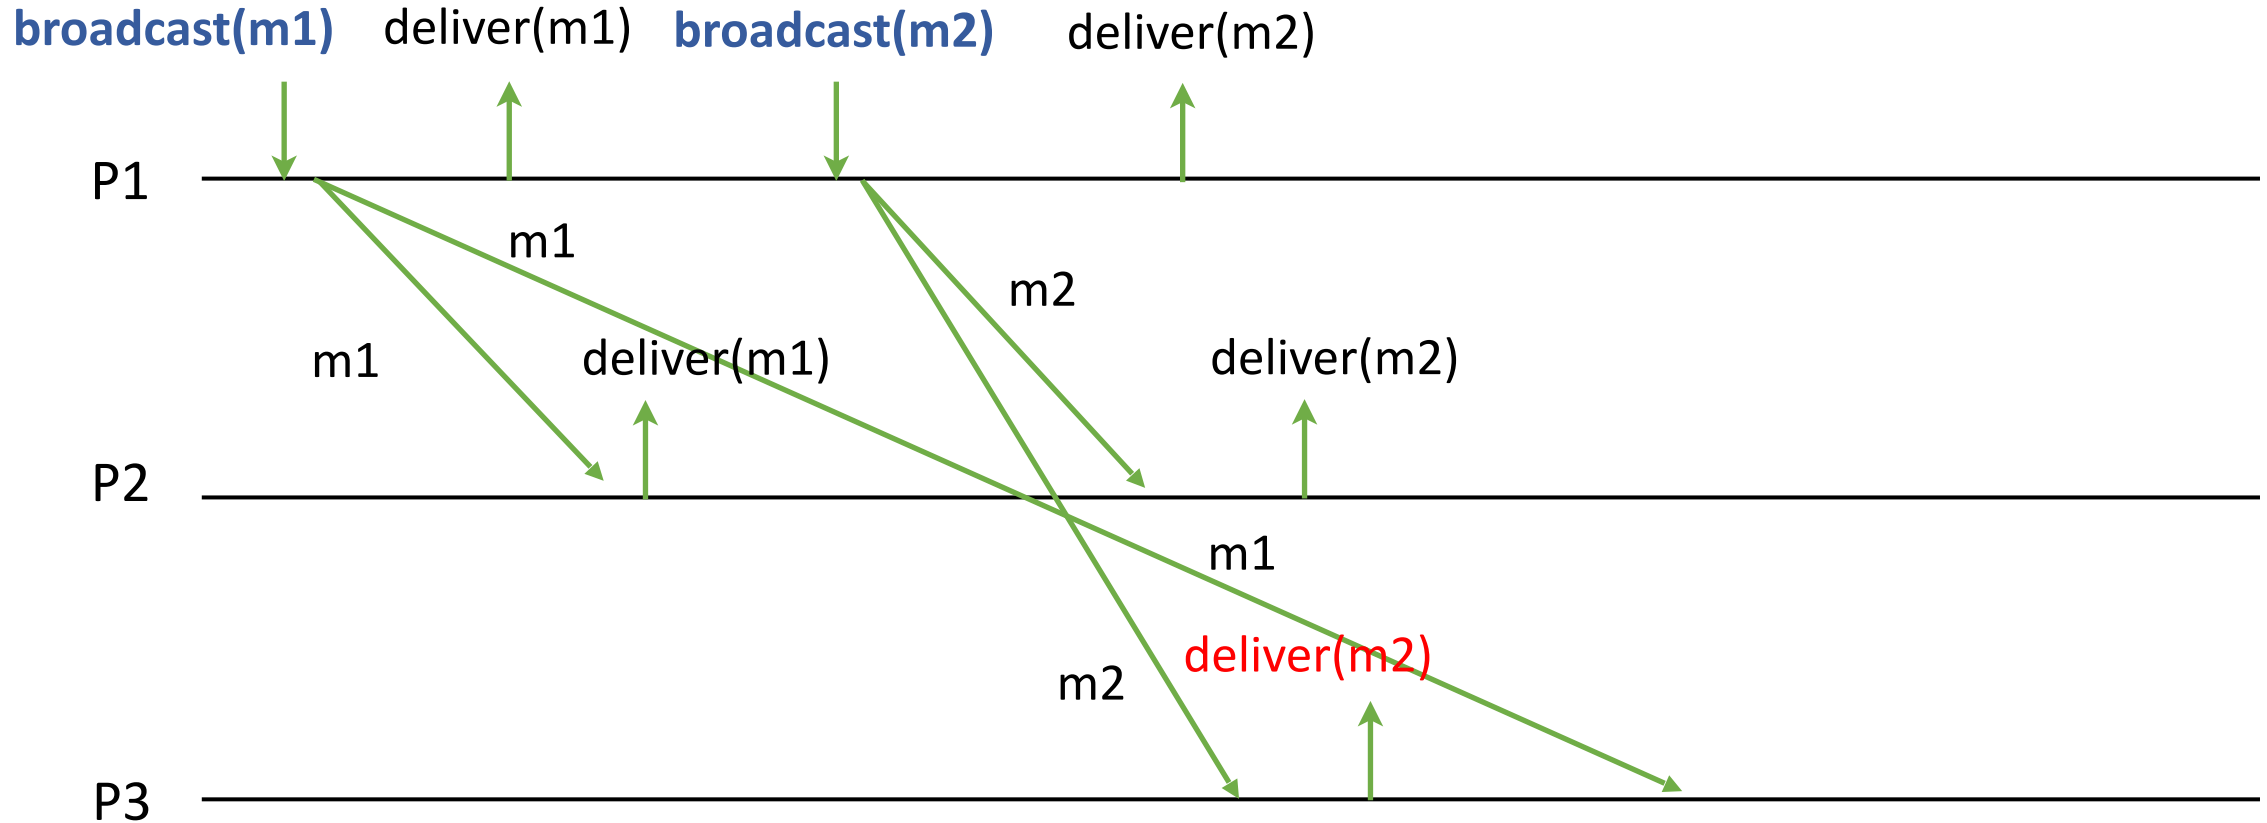

FIFO order of  $p_1$ ,  $m_1 < m_2$ , is not preserved.

# Example 1: FIFO Order

If a process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$  then  $m_1 < m_2$ .

# Example 1: FIFO Order

If a process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$  then  $m_1 < m_2$ .

$m_2$  delivered but  $m_1$  not delivered.  
FIFO order of  $p_1$ ,  $m_1 < m_2$ , is not preserved.

# Causal Relation (Dependency)

---

Let  $m_1$  and  $m_2$  be any two messages.

$m_1 < m_2$  ( $m_1$  is causally before  $m_2$ , or  $m_2$  depends on  $m_1$ ) iff

- **FIFO order:**

A process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$ .

- **InOut order:**

A process  $p_i$  delivers  $m_1$  and then broadcasts  $m_2$ .

- ...

## Example 2: InOut Order

---

If a process  $p_i$  delivers  $m_1$  and then broadcasts  $m_2$  then  $m_1 < m_2$ .

P1

P2

P3

## Example 2: InOut Order

If a process  $p_i$  delivers  $m_1$  and then broadcasts  $m_2$  then  $m_1 < m_2$ .

broadcast( $m_1$ )

## Example 2: InOut Order

If a process  $p_i$  delivers  $m_1$  and then broadcasts  $m_2$  then  $m_1 < m_2$ .

broadcast( $m_1$ )

## Example 2: InOut Order

If a process  $p_i$  delivers  $m_1$  and then broadcasts  $m_2$  then  $m_1 < m_2$ .

## Example 2: InOut Order

If a process  $p_i$  delivers  $m_1$  and then broadcasts  $m_2$  then  $m_1 < m_2$ .

## Example 2: InOut Order

If a process  $p_i$  delivers  $m_1$  and then broadcasts  $m_2$  then  $m_1 < m_2$ .

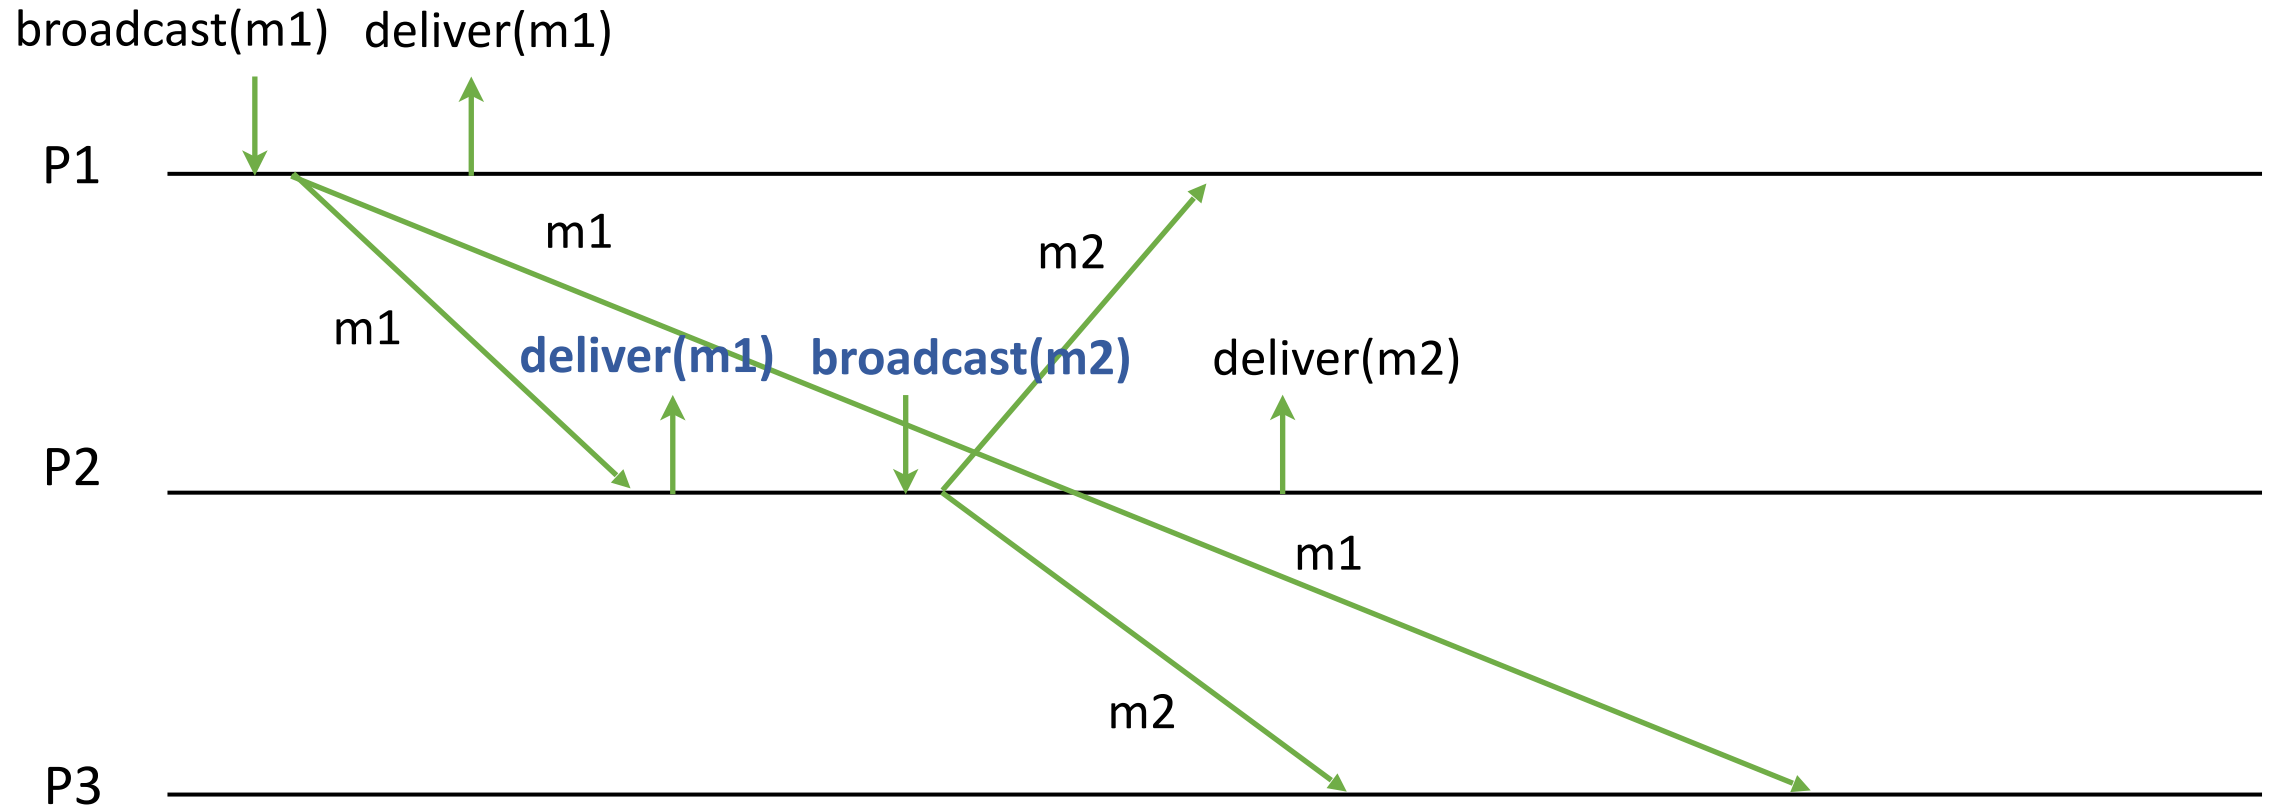

## Example 2: InOut Order

If a process  $p_i$  delivers  $m_1$  and then broadcasts  $m_2$  then  $m_1 < m_2$ .

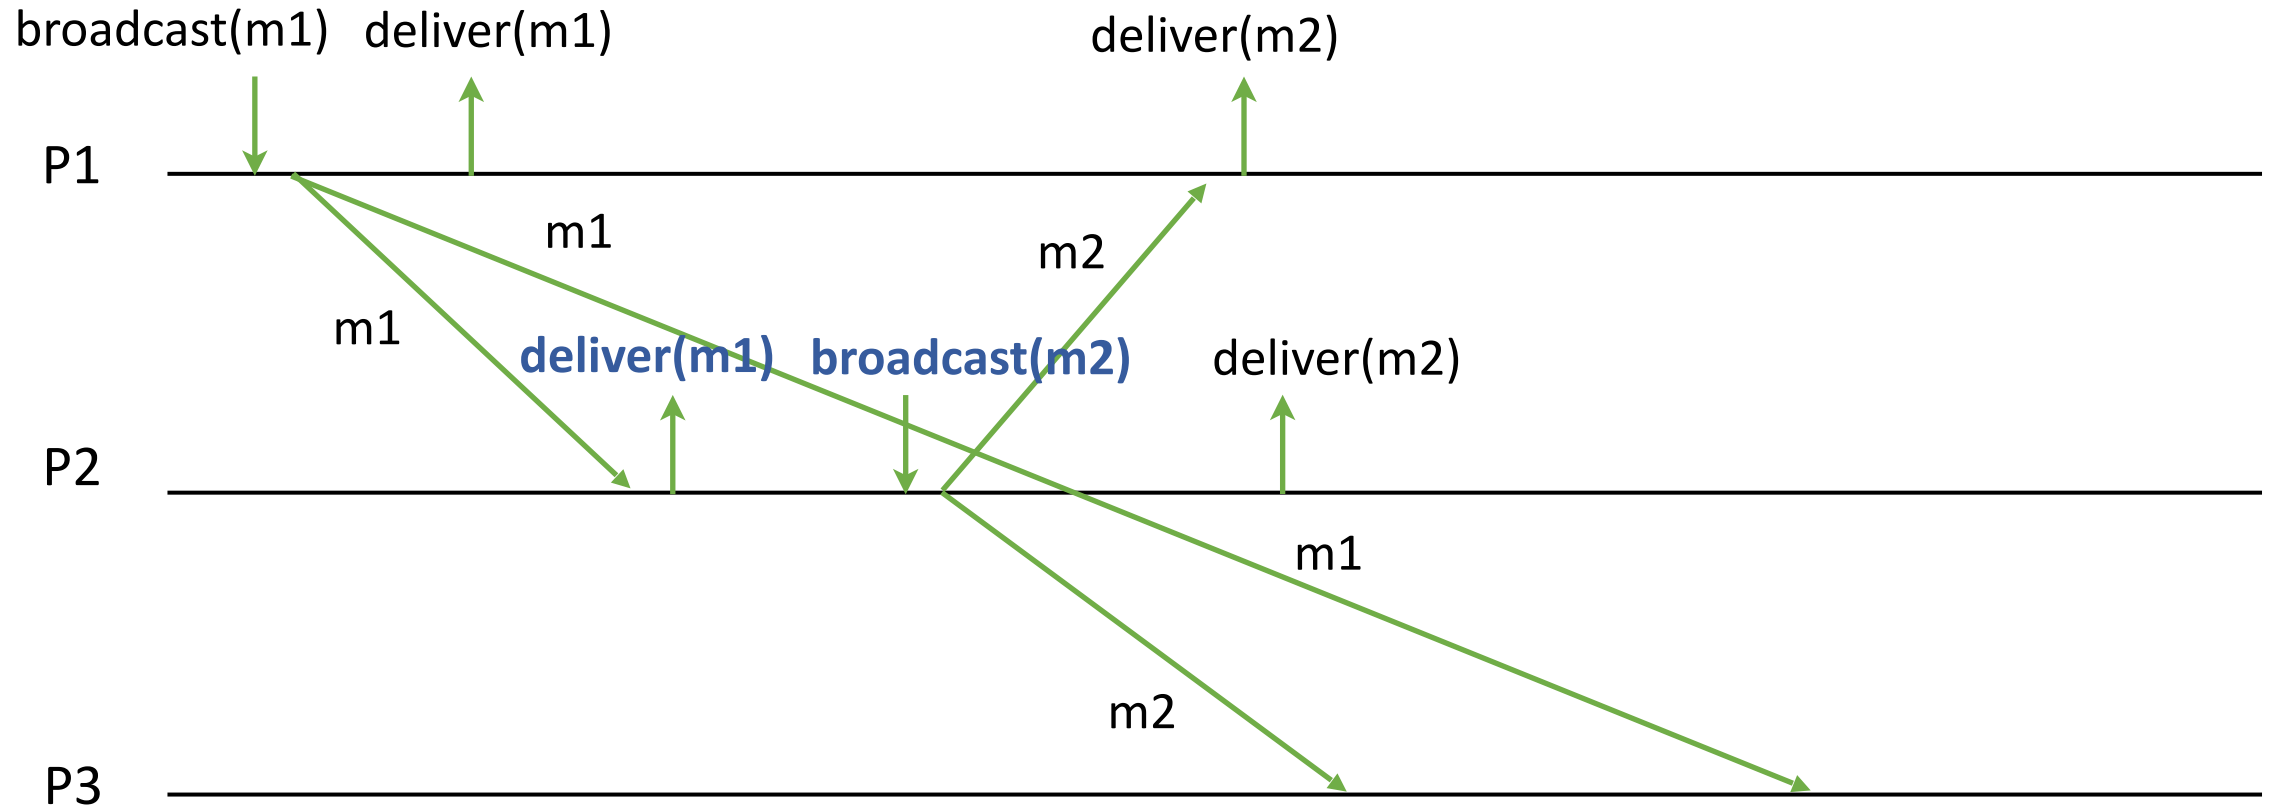

## Example 2: InOut Order

If a process  $p_i$  delivers  $m_1$  and then broadcasts  $m_2$  then  $m_1 < m_2$ .

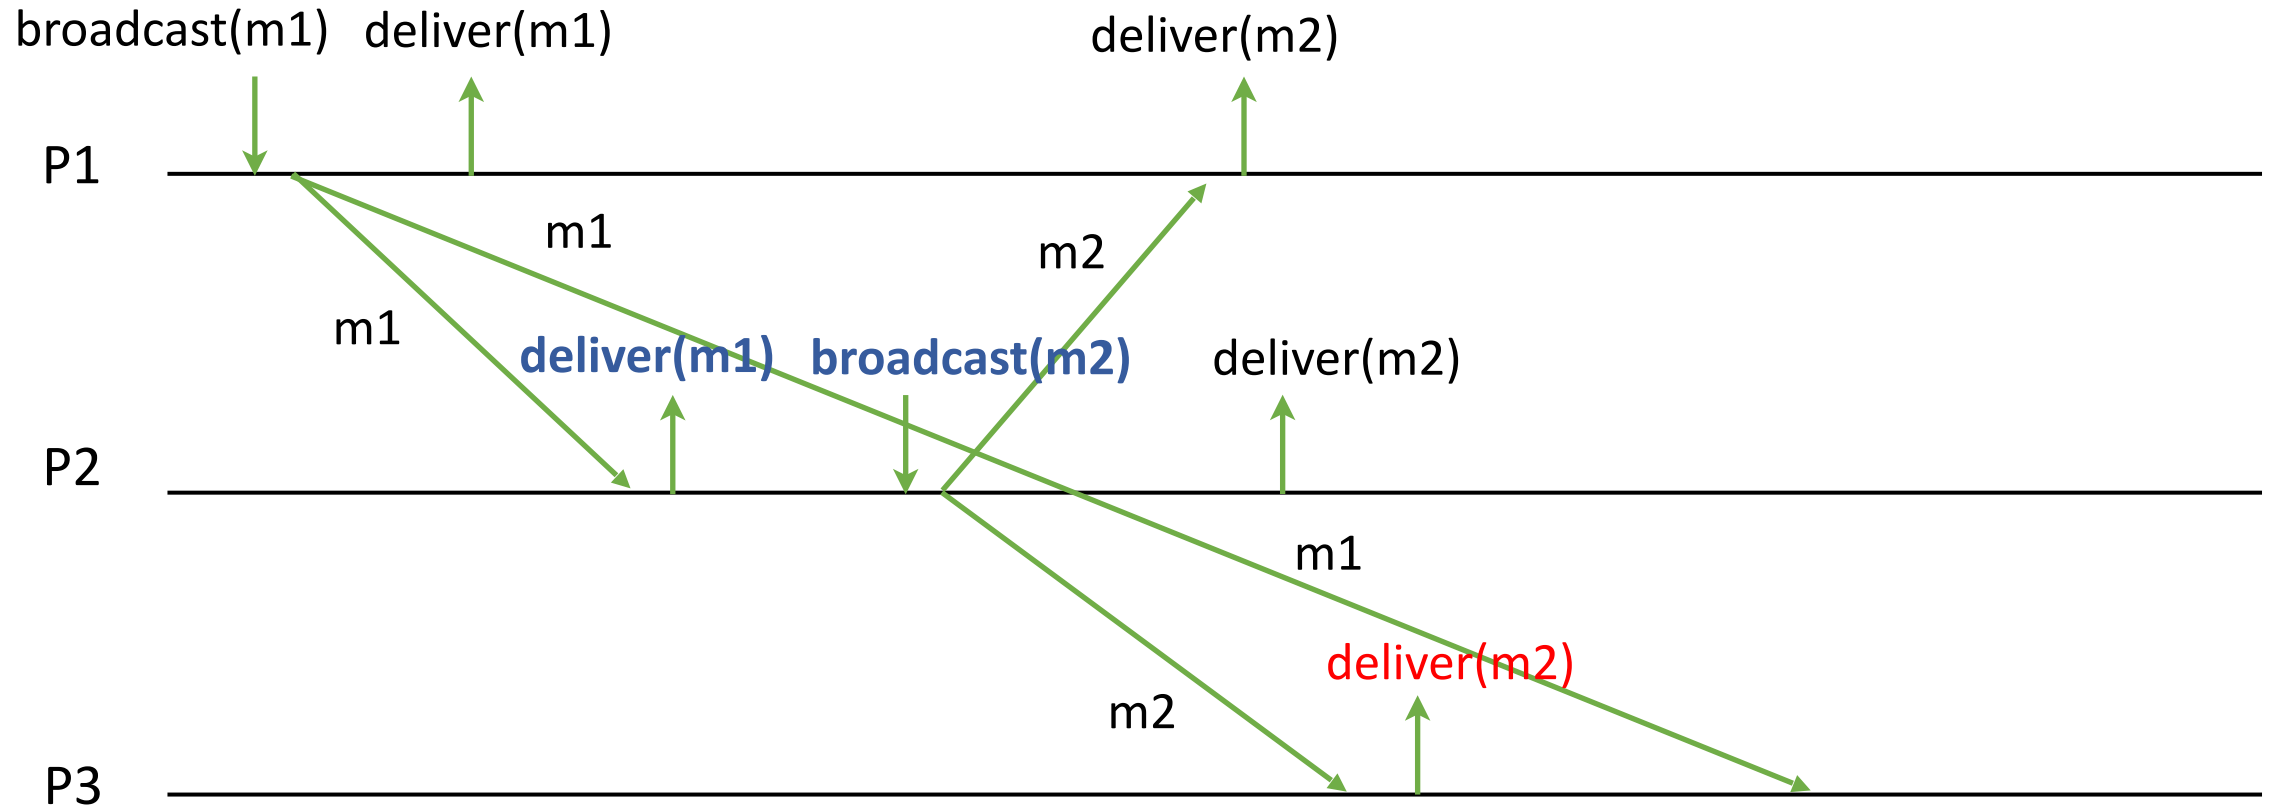

## Example 2: InOut Order

If a process  $p_i$  delivers  $m_1$  and then broadcasts  $m_2$  then then  $m_1 < m_2$ .

## Example 2: InOut Order

If a process  $p_i$  delivers  $m_1$  and then broadcasts  $m_2$  then then  $m_1 < m_2$ .

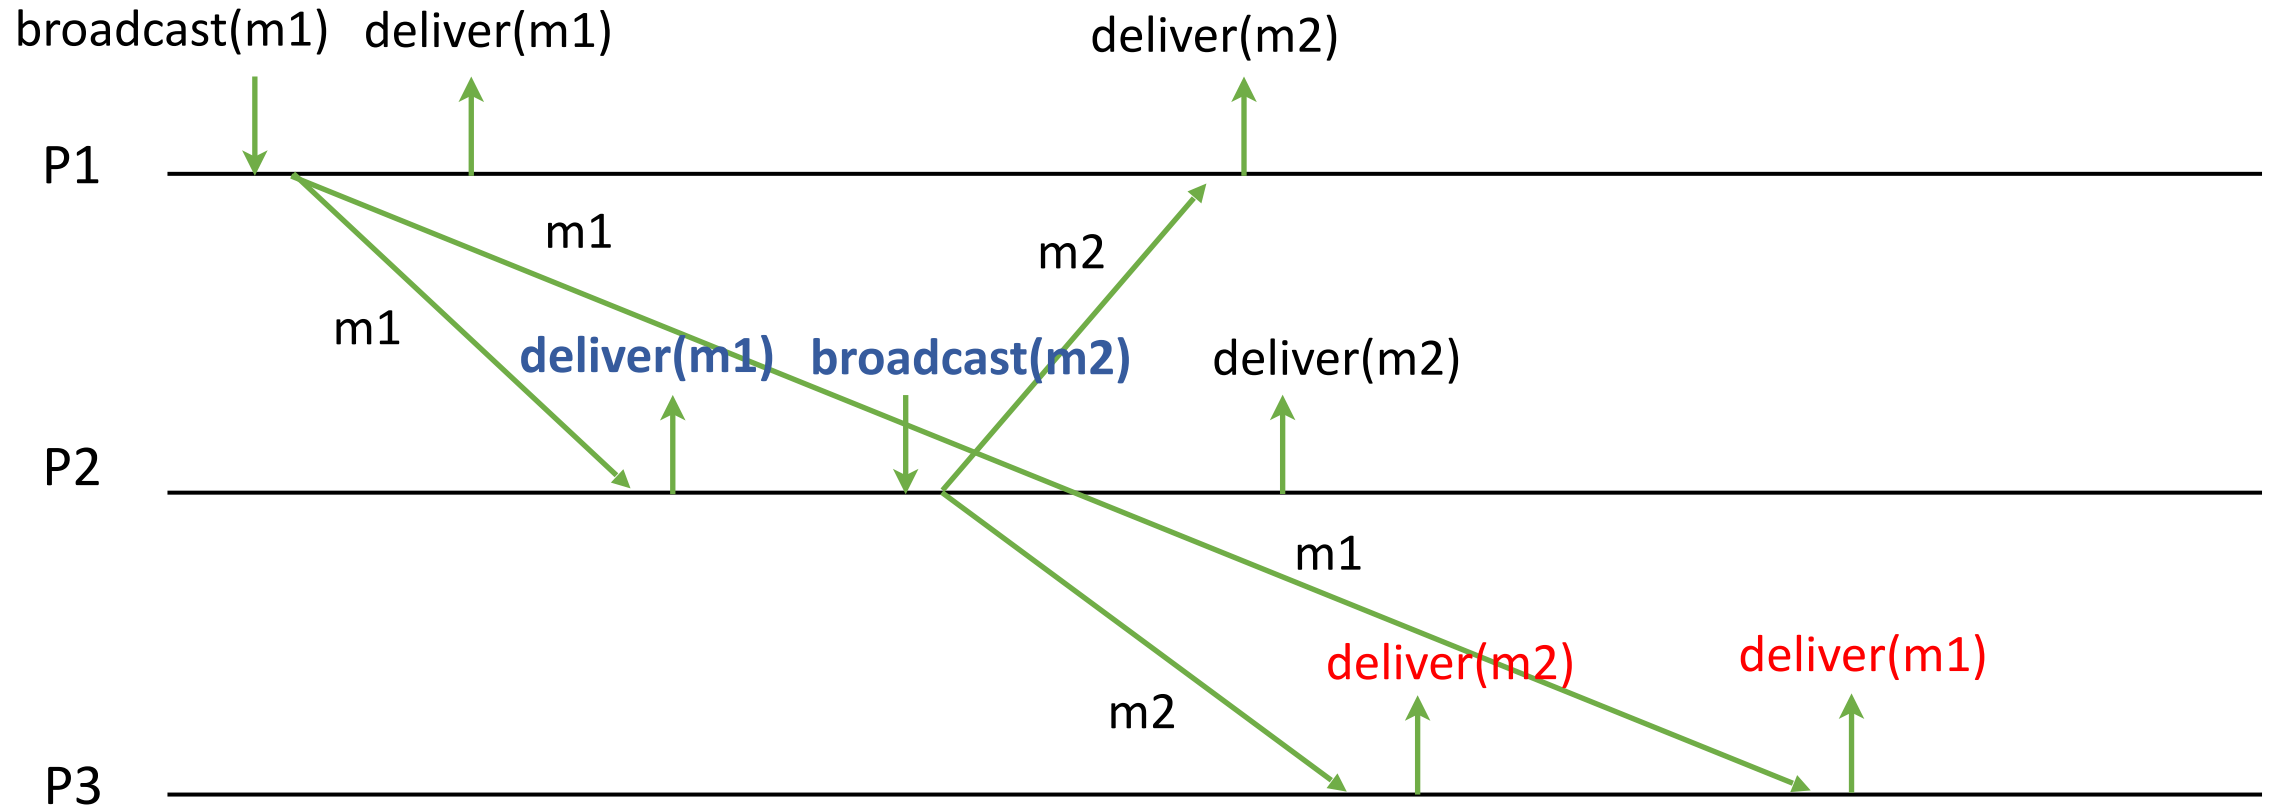

## Example 2: InOut Order

If a process  $p_i$  delivers  $m_1$  and then broadcasts  $m_2$  then then  $m_1 < m_2$ .

## Example 2: InOut Order

If a process  $p_i$  delivers  $m_1$  and then broadcasts  $m_2$  then then  $m_1 < m_2$ .

Local order of  $p_2$ ,  $m_1 < m_2$ , is not preserved.

# Causal Relation (Dependency)

---

Let  $m_1$  and  $m_2$  be any two messages.

$m_1 < m_2$  ( $m_1$  is causally before  $m_2$ , or  $m_2$  depends on  $m_1$ ) iff

- **FIFO order:**  
A process  $p_i$  broadcasts  $m_1$  before broadcasting  $m_2$ .
- **InOut order:**  
A process  $p_i$  delivers  $m_1$  and then broadcasts  $m_2$ .
- **Transitivity:**  
There is a message  $m_3$  such that  $m_1 < m_3$  and  $m_3 < m_2$ .

# Uniform Causal Broadcast (UCB)

---

- **Events**

- Request: <broadcast (m)>
- Indication: <deliver (src, m)>

also called ucbBroadcast and ucbDeliver.

- **Properties:**

- URB1, URB2, URB3, URB4 +
- CO

# Overview

---

- Motivation: why causal broadcast?
- Properties of causal broadcast
- **Protocols**

# Protocols

---

How do we preserve the causal order?

# Protocol 1

---

Idea:

Remember the past messages and  
sent them together with every new message.

# Example 1: FIFO Order

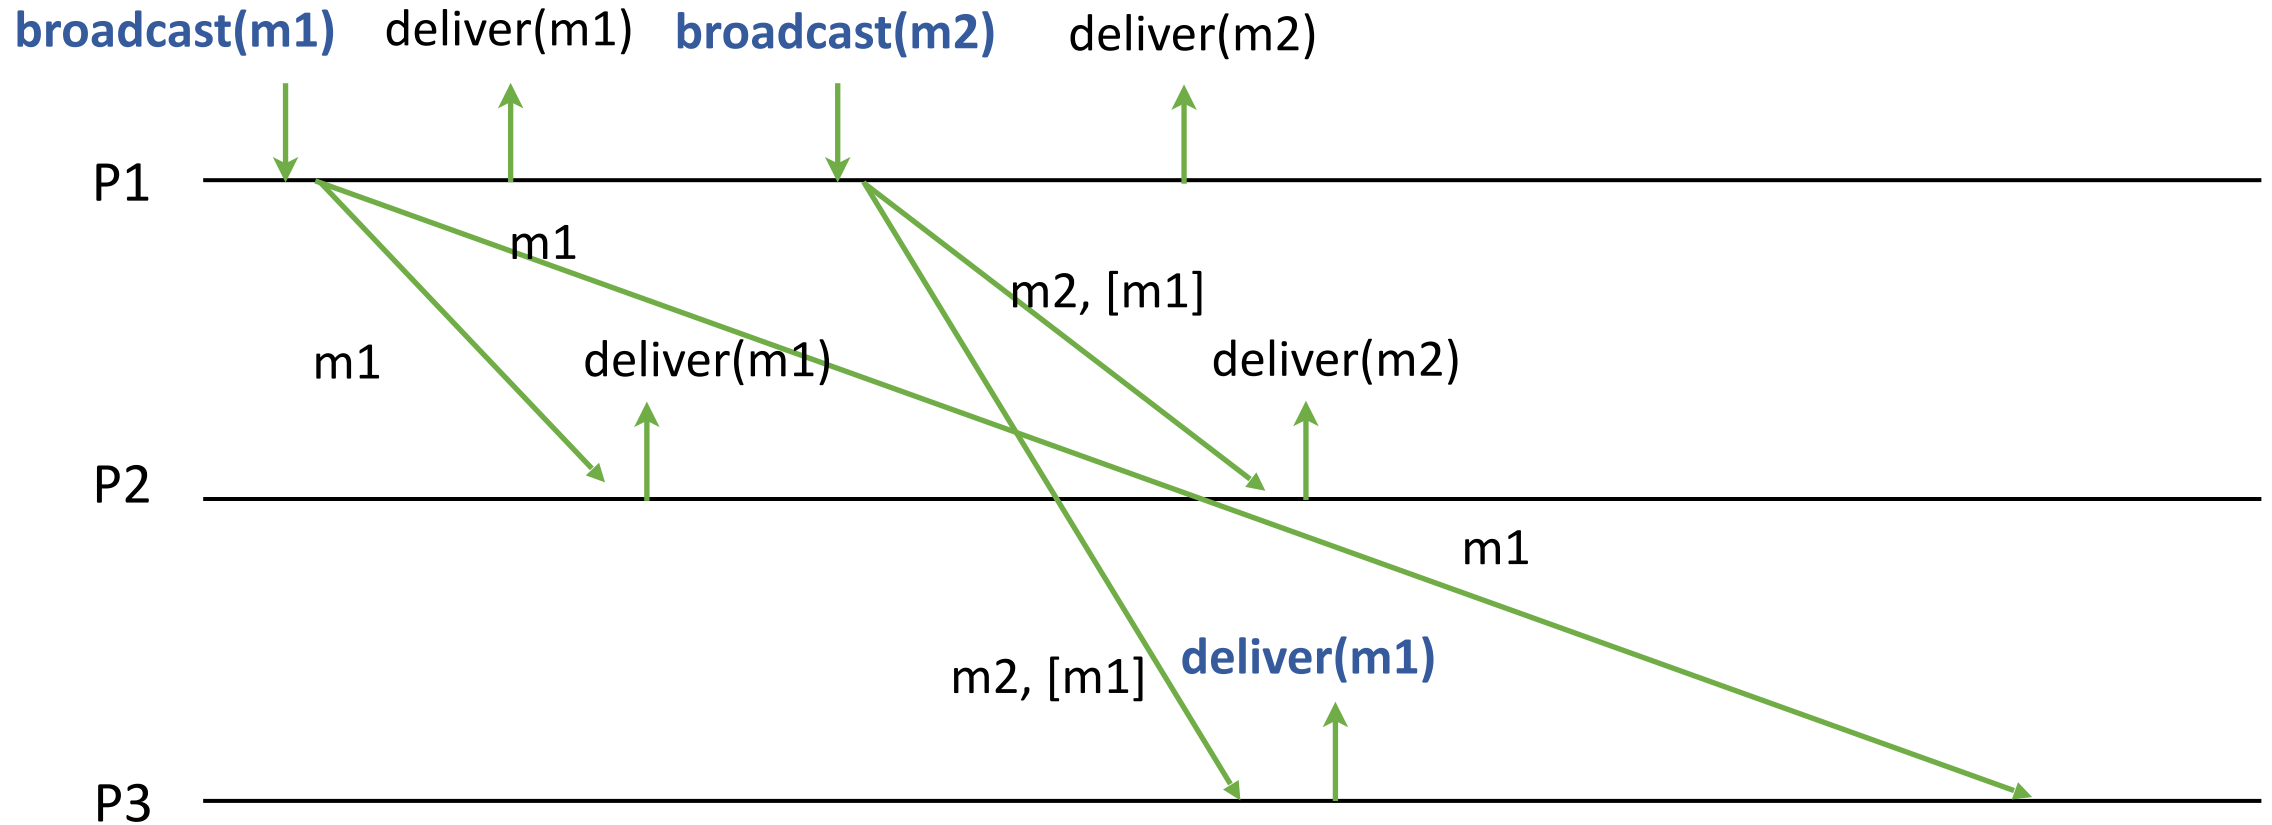

**broadcast(m1)** deliver(m1) **broadcast(m2)**

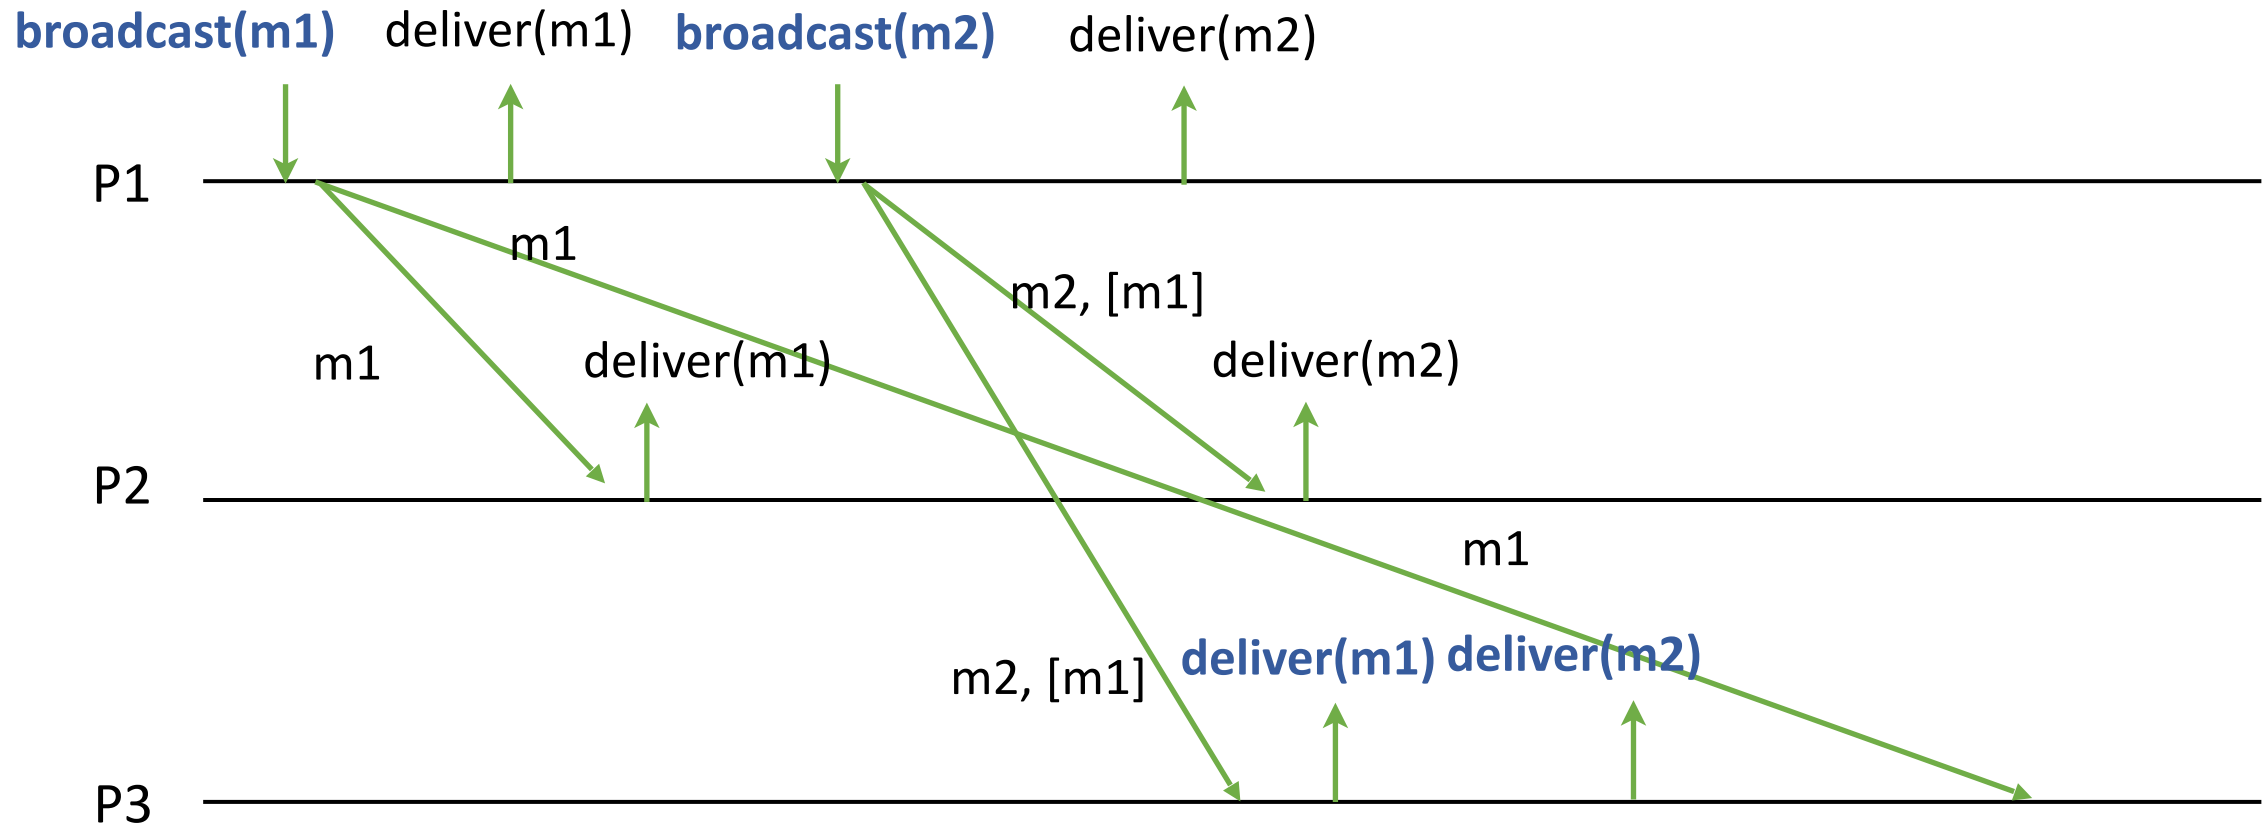

# Example 1: FIFO Order

# Example 1: FIFO Order

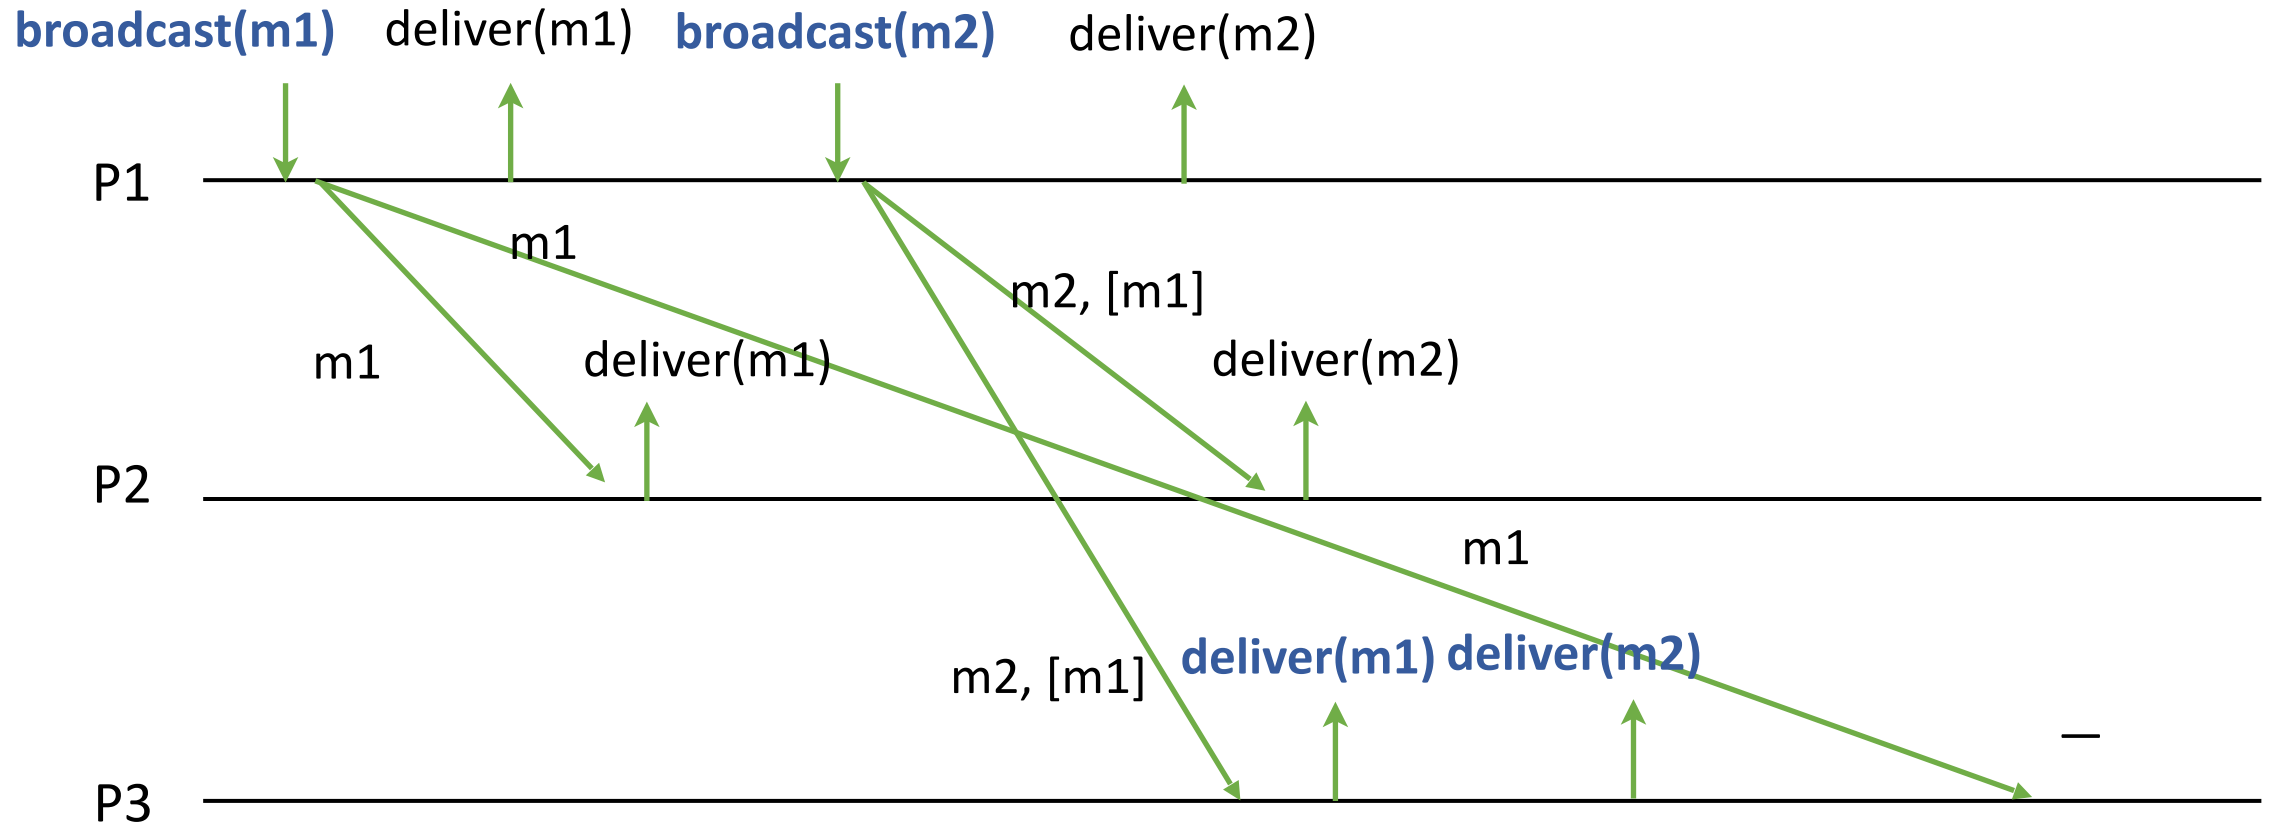

# Example 1: FIFO Order

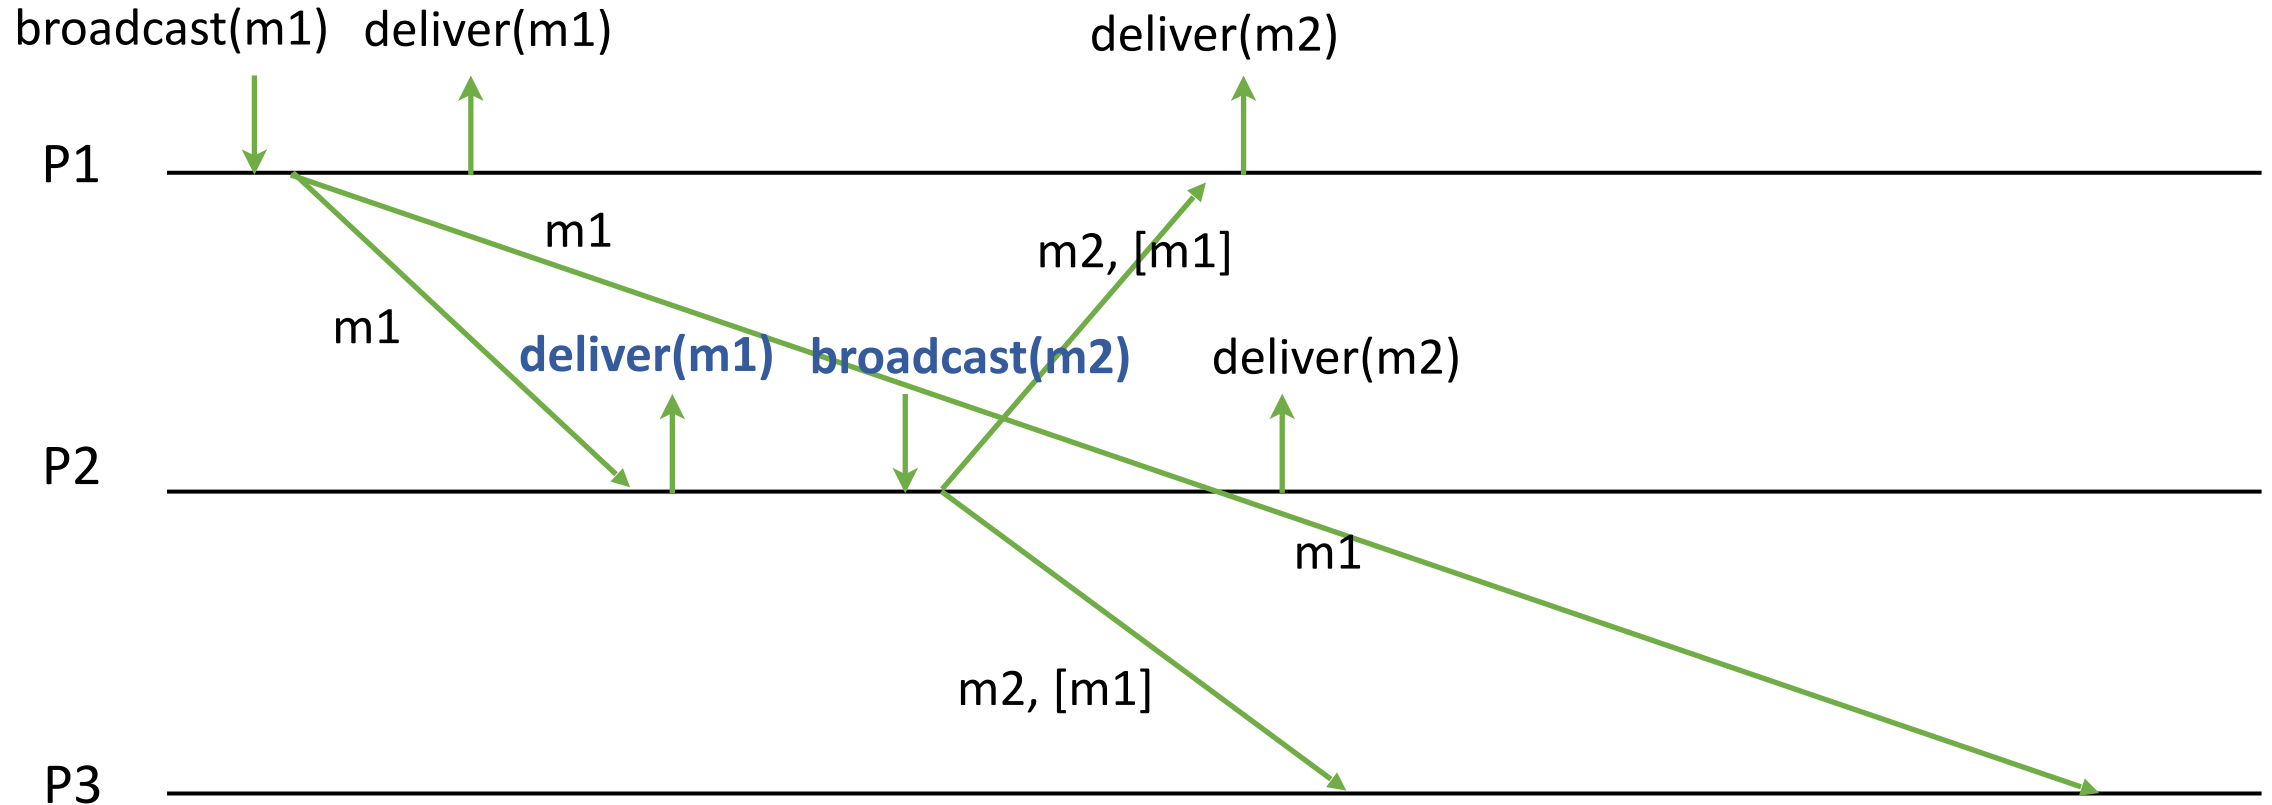

# Example 1: FIFO Order

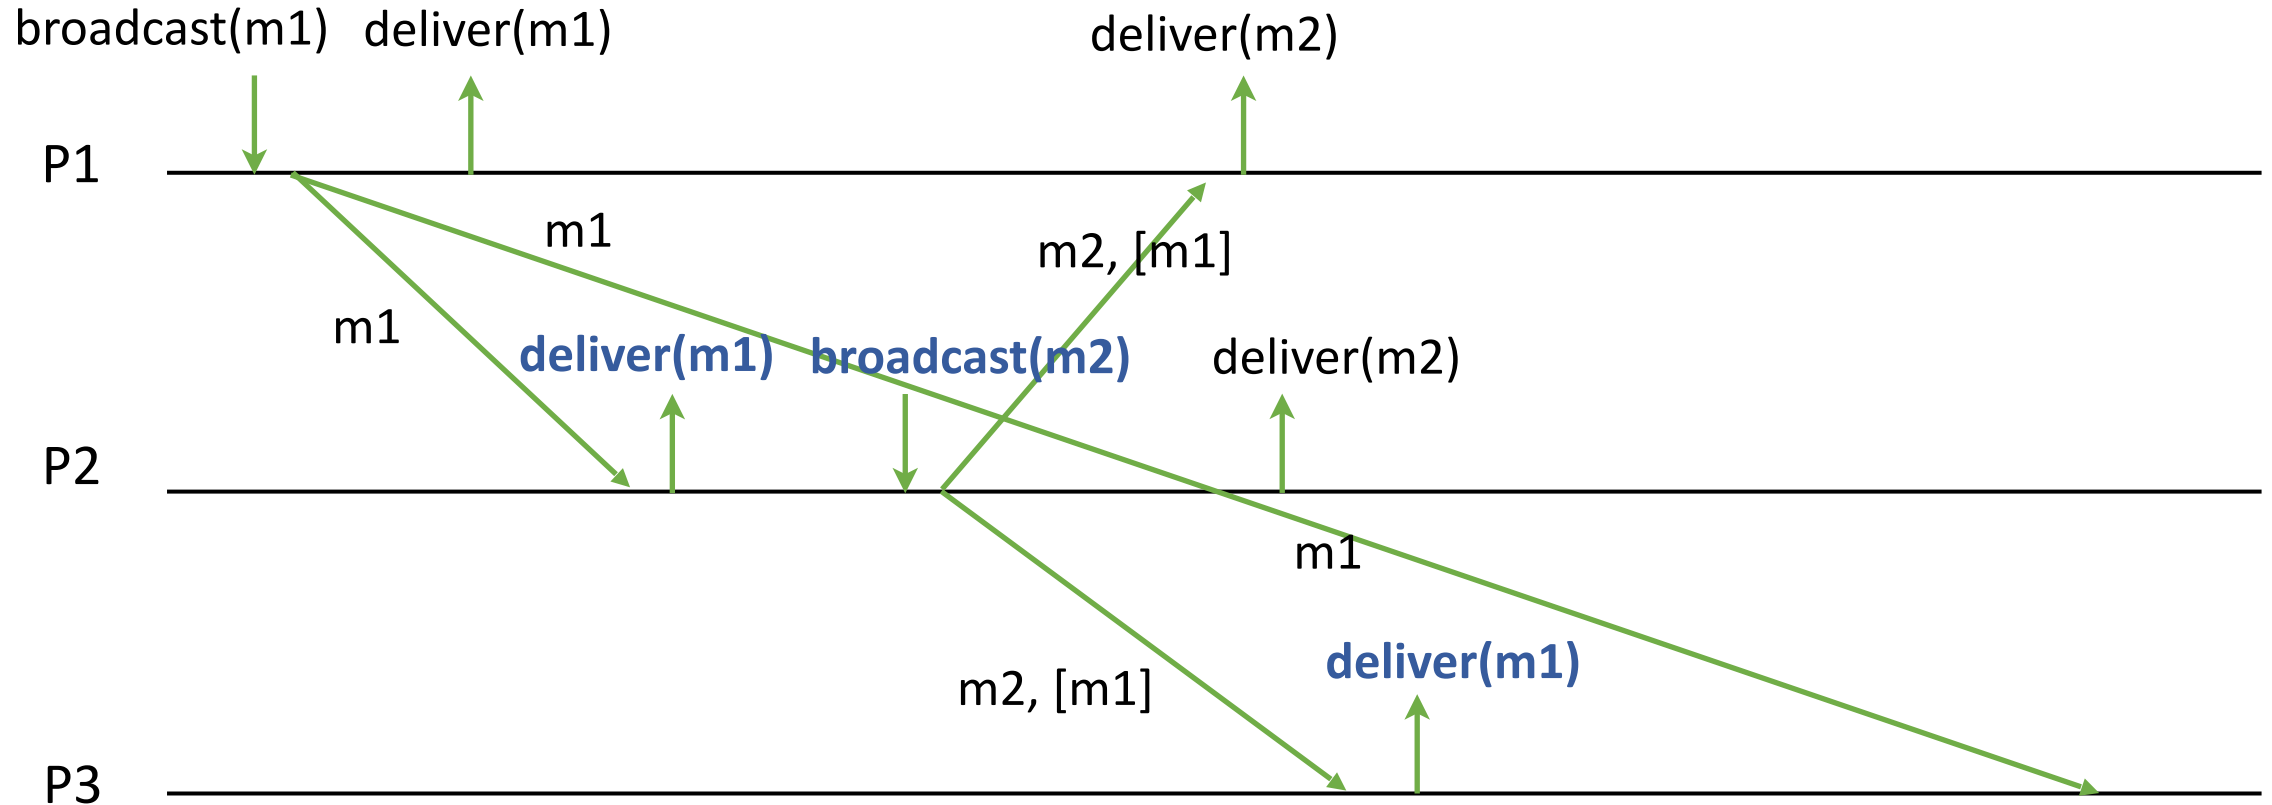

# Example 2: InOut Order

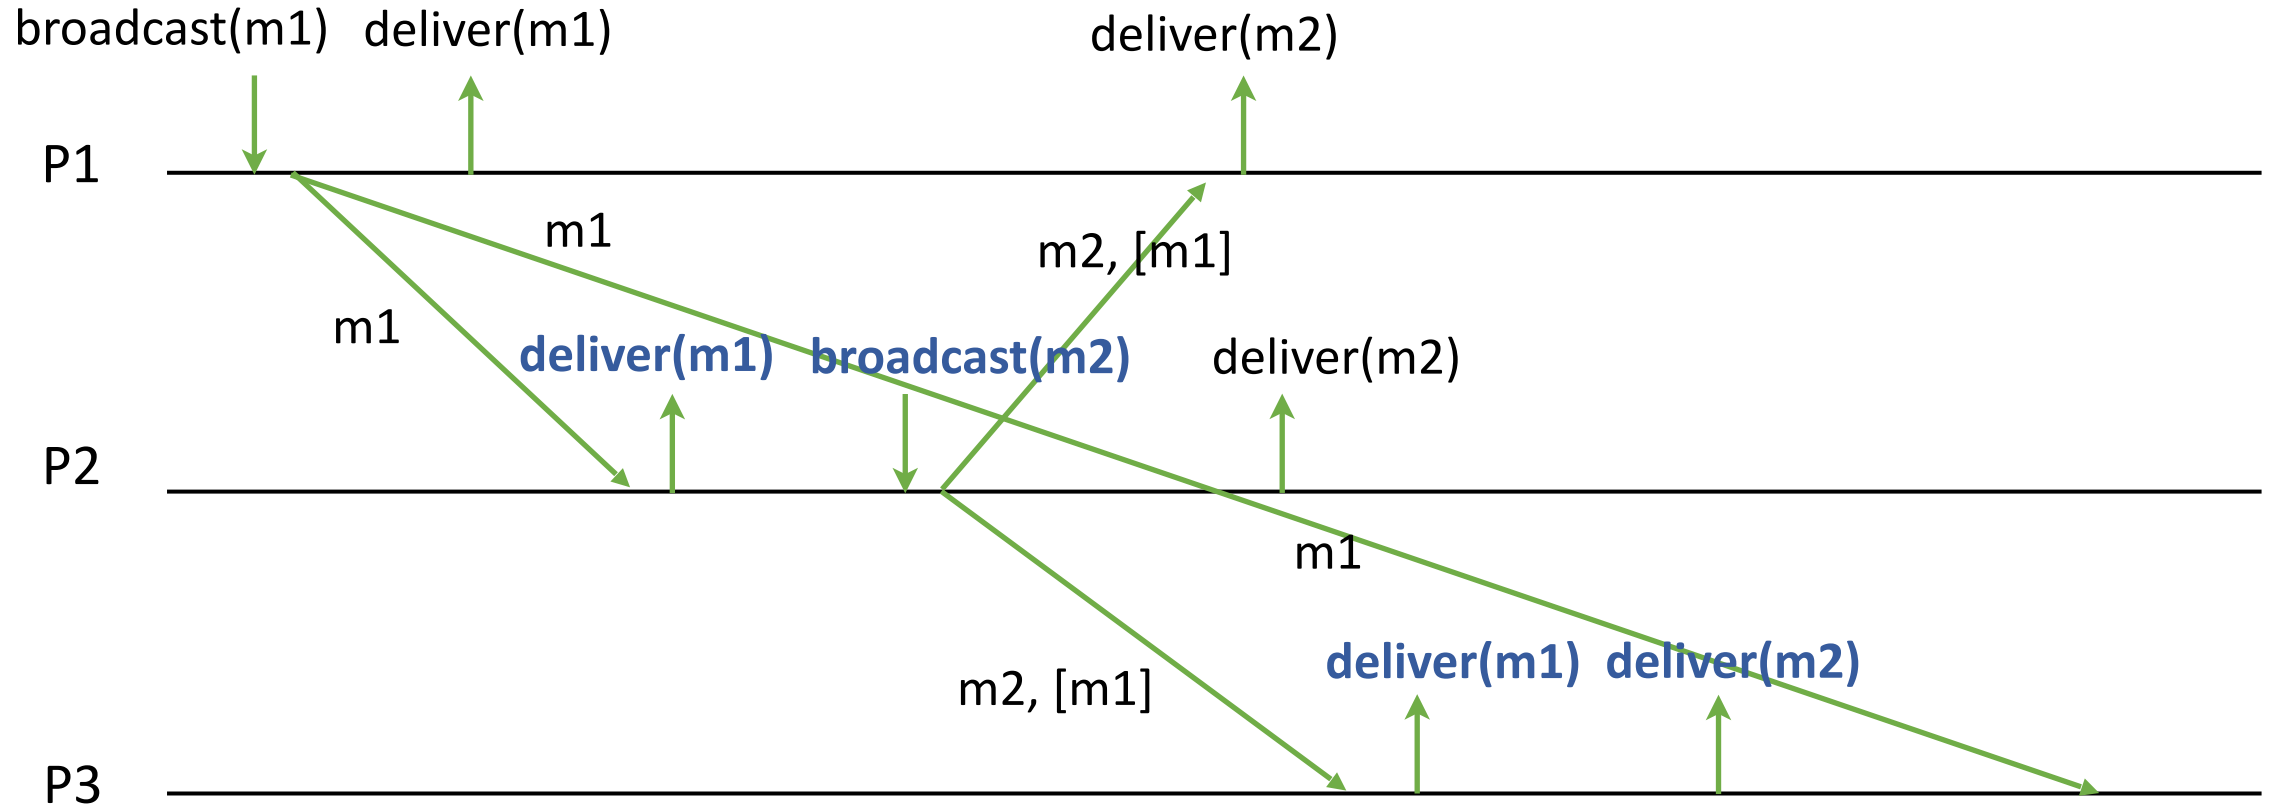

# Example 2: InOut Order

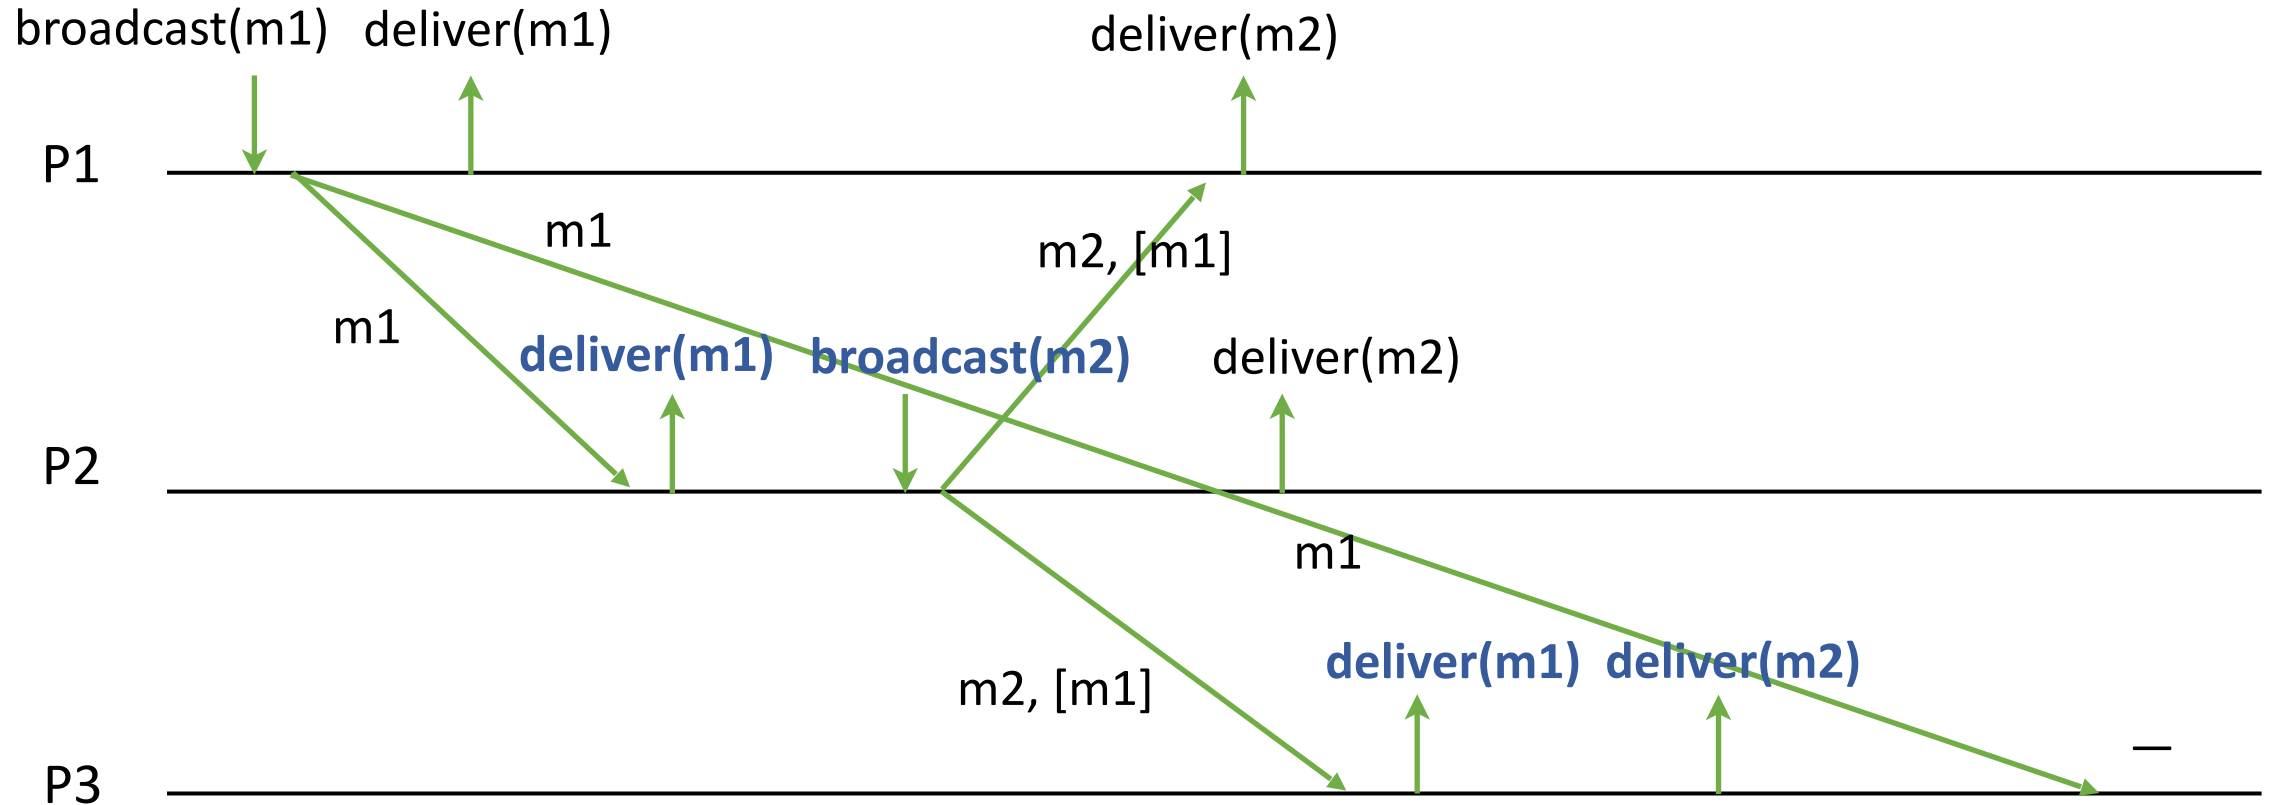

# Example 2: InOut Order

# Example 2: InOut Order

# Example 2: InOut Order

# Observation

---

Messages that carry the past are large!

# Protocol 2

---

Idea:

- Keep the number of messages delivered from each process as a vector (clock) of numbers.\*

$p_1$	$p_2$	$p_3$
2	1	0

- Send the vector clock (VC) together with new messages.  
(\*except for the current process that is updated with the number of broadcast messages.)

## Protocol 2

---

- Deliver a message only if the local vector clock is larger than (or equal to) the vector clock of the message.

# Modular Design

# Protocol 1

---

**Implements:** UniformCausalBroadcast (ucb).

**Uses:** UniformReliableBroadcast (urb).

# Protocol 1

---

**Implements:** UniformCausalBroadcast (ucb).

**Uses:** UniformReliableBroadcast (urb).

Similarly Reliable broadcast can be used to get Reliable causal broadcast.

# Protocol 1

---

**Implements:** UniformCausalBroadcast (ucb).

**Uses:** UniformReliableBroadcast (urb).

**upon event** < Init > **do**

delivered := past :=  $\emptyset$

Similarly Reliable broadcast can be used to get Reliable causal broadcast.

# Protocol 1

---

**Implements:** UniformCausalBroadcast (ucb).

**Uses:** UniformReliableBroadcast (urb).

**upon event** < Init > **do**

delivered := past :=  $\emptyset$

**upon event** < broadcast (m) > **do**

**trigger** < urb, broadcast ([past, m]) >

past := past U {[self, m]}

Similarly Reliable broadcast can be used to get Reliable causal broadcast.

# Protocol 1

---

**Implements:** UniformCausalBroadcast (ucb).

**Uses:** UniformReliableBroadcast (urb).

**upon event** < Init > **do**

delivered := past :=  $\emptyset$

**upon event** < broadcast (m) > **do**

**trigger** < urb, broadcast ([past, m]) >

past := past  $\cup$  {[self, m]}

Similarly Reliable broadcast can be used to get Reliable causal broadcast.

Every new message is added to past. This preserves the FIFO order property.

# Protocol 1

---

```
upon event <urb, deliver (pi, [pastm, m])> do  
  if m  $\notin$  delivered then  
    forall [sn, n]  $\in$  pastm do  
      if n  $\notin$  delivered then  
        trigger < deliver (sn, n) >  
        delivered := delivered U {n}  
        past := past U {[sn, n]}
```

# Protocol 1

---

```
upon event <urb, deliver (pi, [pastm, m])> do  
  if m  $\notin$  delivered then  
    forall [sn, n]  $\in$  pastm do  
      if n  $\notin$  delivered then  
        trigger < deliver (sn, n) >  
        delivered := delivered U {n}  
        past := past U {[sn, n]}
```

The set pastm is added to past.  
This preserves the transitivity property.

# Protocol 1

---

**upon event**  $\langle \text{urb}, \text{deliver}(\text{pi}, [\text{pastm}, \text{m}]) \rangle$  **do**

**if**  $\text{m} \notin \text{delivered}$  **then**

**forall**  $[\text{sn}, \text{n}] \in \text{pastm}$  **do**

**if**  $\text{n} \notin \text{delivered}$  **then**

**trigger**  $\langle \text{deliver}(\text{sn}, \text{n}) \rangle$

$\text{delivered} := \text{delivered} \cup \{\text{n}\}$

$\text{past} := \text{past} \cup \{[\text{sn}, \text{n}]\}$

**trigger**  $\langle \text{deliver}(\text{pi}, \text{m}) \rangle$

$\text{delivered} := \text{delivered} \cup \{\text{m}\}$

$\text{past} := \text{past} \cup \{[\text{pi}, \text{m}]\}$

The set  $\text{pastm}$  is added to  $\text{past}$ .  
This preserves the transitivity property.

# Protocol 1

---

**upon event**  $\langle \text{urb}, \text{deliver}(\text{pi}, [\text{pastm}, \text{m}]) \rangle$  **do**

**if**  $\text{m} \notin \text{delivered}$  **then**

**forall**  $[\text{sn}, \text{n}] \in \text{pastm}$  **do**

**if**  $\text{n} \notin \text{delivered}$  **then**

**trigger**  $\langle \text{deliver}(\text{sn}, \text{n}) \rangle$

$\text{delivered} := \text{delivered} \cup \{\text{n}\}$

$\text{past} := \text{past} \cup \{[\text{sn}, \text{n}]\}$

**trigger**  $\langle \text{deliver}(\text{pi}, \text{m}) \rangle$

$\text{delivered} := \text{delivered} \cup \{\text{m}\}$

$\text{past} := \text{past} \cup \{[\text{pi}, \text{m}]\}$

The set  $\text{pastm}$  is added to  $\text{past}$ .  
This preserves the transitivity property.

Every delivered message is added to  $\text{past}$ .  
This preserves the InOut property.

# Observation

---

If we keep remembering the past,  
we eventually run out of space!

# Protocol 1 + Garbage Collection

---

Idea:

- Broadcast an ack when a message is delivered.
- Forget a message after receiving acks from all correct processes.

# Protocol 1 + Garbage Collection

---

**Implements:** CausalOrderBroadcast (co).

**Uses:**

ReliableBroadcast (rb).

PerfectFailureDetector (P).

**upon event** < Init > **do**

...

correct :=  $\Pi$

ack(m) :=  $\emptyset$  (for all m)

# Protocol 1 + Garbage Collection

---

**upon event**  $\langle P, \text{crash}(p_i) \rangle$  **do**  
     $\text{correct} := \text{correct} \setminus \{p_i\}$

# Protocol 1 + Garbage Collection

---

**upon event**  $\langle P, \text{crash}(p_i) \rangle$  **do**

correct := correct  $\setminus \{p_i\}$

**upon event**  $\langle \text{urb}, \text{deliver}(p, \text{Msg}[\text{pastm}, m]) \rangle$  **do**

...

**trigger**  $\langle \text{urb}, \text{broadcast}(\text{Ack}[p, m]) \rangle$

# Protocol 1 + Garbage Collection

---

**upon event**  $\langle P, \text{crash}(p_i) \rangle$  **do**

correct := correct  $\setminus$   $\{p_i\}$

**upon event**  $\langle \text{urb}, \text{deliver}(p, \text{Msg}[\text{past}_m, m]) \rangle$  **do**

...

**trigger**  $\langle \text{urb}, \text{broadcast}(\text{Ack}[p, m]) \rangle$

**upon event**  $\langle \text{urb}, \text{deliver}(p, \text{Ack}[s, m]) \rangle$  **do**

ack(m) := ack(m)  $\cup$   $\{p\}$

**if** correct  $\subseteq$  ack(m) **then**

past := past  $\setminus$   $\{[s, m]\}$

# Protocol 2

---

**Implements:** UniformCausalBroadcast (ucb).

**Uses:** UniformReliableBroadcast (urb).

**upon event** < Init > **do**

sq := 0

**foreach** pi in  $\Pi$ : VC[pi] := 0

## Protocol 2

---

**upon event** < broadcast (m) > **do**

VC' = VC[self  $\mapsto$  sq]

**trigger** < urb, broadcast ([VC', m]) >

sq = sq + 1

## Protocol 2

---

**upon event** < broadcast (m) > **do**

VC' = VC[self  $\mapsto$  sq]

**trigger** < urb, broadcast ([VC', m]) >

sq = sq + 1

**upon event** < urb, deliver (pj, [VCm, m]) > **do**

**wait until** (VC  $\geq$  Vcm)

**trigger** < deliver (pj, m) >

VC[pj] := VC[pj] + 1
